

# **Sun Java System Application Server 9.1 Administration Reference**

Sun Microsystems, Inc.  
4150 Network Circle  
Santa Clara, CA 95054  
U.S.A.

Part No: 819-3674-11  
September 2007

Copyright 2007 Sun Microsystems, Inc. 4150 Network Circle, Santa Clara, CA 95054 U.S.A. All rights reserved.

Sun Microsystems, Inc. has intellectual property rights relating to technology embodied in the product that is described in this document. In particular, and without limitation, these intellectual property rights may include one or more U.S. patents or pending patent applications in the U.S. and in other countries.

U.S. Government Rights – Commercial software. Government users are subject to the Sun Microsystems, Inc. standard license agreement and applicable provisions of the FAR and its supplements.

This distribution may include materials developed by third parties.

Parts of the product may be derived from Berkeley BSD systems, licensed from the University of California. UNIX is a registered trademark in the U.S. and other countries, exclusively licensed through X/Open Company, Ltd.

Sun, Sun Microsystems, the Sun logo, the Solaris logo, the Java Coffee Cup logo, docs.sun.com, Java, and Solaris are trademarks or registered trademarks of Sun Microsystems, Inc. in the U.S. and other countries. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. in the U.S. and other countries. Products bearing SPARC trademarks are based upon an architecture developed by Sun Microsystems, Inc.

The OPEN LOOK and Sun<sup>TM</sup> Graphical User Interface was developed by Sun Microsystems, Inc. for its users and licensees. Sun acknowledges the pioneering efforts of Xerox in researching and developing the concept of visual or graphical user interfaces for the computer industry. Sun holds a non-exclusive license from Xerox to the Xerox Graphical User Interface, which license also covers Sun's licensees who implement OPEN LOOK GUIs and otherwise comply with Sun's written license agreements.

Products covered by and information contained in this publication are controlled by U.S. Export Control laws and may be subject to the export or import laws in other countries. Nuclear, missile, chemical or biological weapons or nuclear maritime end uses or end users, whether direct or indirect, are strictly prohibited. Export or reexport to countries subject to U.S. embargo or to entities identified on U.S. export exclusion lists, including, but not limited to, the denied persons and specially designated nationals lists is strictly prohibited.

DOCUMENTATION IS PROVIDED "AS IS" AND ALL EXPRESS OR IMPLIED CONDITIONS, REPRESENTATIONS AND WARRANTIES, INCLUDING ANY IMPLIED WARRANTY OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT, ARE DISCLAIMED, EXCEPT TO THE EXTENT THAT SUCH DISCLAIMERS ARE HELD TO BE LEGALLY INVALID.

---

Copyright 2007 Sun Microsystems, Inc. 4150 Network Circle, Santa Clara, CA 95054 U.S.A. Tous droits réservés.

Sun Microsystems, Inc. détient les droits de propriété intellectuelle relatifs à la technologie incorporée dans le produit qui est décrit dans ce document. En particulier, et ce sans limitation, ces droits de propriété intellectuelle peuvent inclure un ou plusieurs brevets américains ou des applications de brevet en attente aux Etats-Unis et dans d'autres pays.

Cette distribution peut comprendre des composants développés par des tierces personnes.

Certains composants de ce produit peuvent être dérivées du logiciel Berkeley BSD, licenciés par l'Université de Californie. UNIX est une marque déposée aux Etats-Unis et dans d'autres pays; elle est licenciée exclusivement par X/Open Company, Ltd.

Sun, Sun Microsystems, le logo Sun, le logo Solaris, le logo Java Coffee Cup, docs.sun.com, Java et Solaris sont des marques de fabrique ou des marques déposées de Sun Microsystems, Inc. aux Etats-Unis et dans d'autres pays. Toutes les marques SPARC sont utilisées sous licence et sont des marques de fabrique ou des marques déposées de SPARC International, Inc. aux Etats-Unis et dans d'autres pays. Les produits portant les marques SPARC sont basés sur une architecture développée par Sun Microsystems, Inc.

L'interface d'utilisation graphique OPEN LOOK et Sun a été développée par Sun Microsystems, Inc. pour ses utilisateurs et licenciés. Sun reconnaît les efforts de pionniers de Xerox pour la recherche et le développement du concept des interfaces d'utilisation visuelle ou graphique pour l'industrie de l'informatique. Sun détient une licence non exclusive de Xerox sur l'interface d'utilisation graphique Xerox, cette licence couvrant également les licenciés de Sun qui mettent en place l'interface d'utilisation graphique OPEN LOOK et qui, en outre, se conforment aux licences écrites de Sun.

Les produits qui font l'objet de cette publication et les informations qu'il contient sont régis par la législation américaine en matière de contrôle des exportations et peuvent être soumis au droit d'autres pays dans le domaine des exportations et importations. Les utilisations finales, ou utilisateurs finaux, pour des armes nucléaires, des missiles, des armes chimiques ou biologiques ou pour le nucléaire maritime, directement ou indirectement, sont strictement interdites. Les exportations ou réexportations vers des pays sous embargo des Etats-Unis, ou vers des entités figurant sur les listes d'exclusion d'exportation américaines, y compris, mais de manière non exclusive, la liste de personnes qui font objet d'un ordre de ne pas participer, d'une façon directe ou indirecte, aux exportations des produits ou des services qui sont régis par la législation américaine en matière de contrôle des exportations et la liste de ressortissants spécifiquement désignés, sont rigoureusement interdites.

LA DOCUMENTATION EST FOURNIE "EN L'ETAT" ET TOUTES AUTRES CONDITIONS, DECLARATIONS ET GARANTIES EXPRESSES OU TACITES SONT FORMELLEMENT EXCLUES, DANS LA MESURE AUTORISEE PAR LA LOI APPLICABLE, Y COMPRIS NOTAMMENT TOUTE GARANTIE IMPLICITE RELATIVE A LA QUALITE MARCHANDE, A L'APTITUDE A UNE UTILISATION PARTICULIERE OU A L'ABSENCE DE CONTREFACON.

# Preface

---

This *Administration Reference* provides information about the Sun Java System Application Server configuration file, `domain.xml`. This file contains most of the Application Server configuration.

This preface contains information about and conventions for the entire Sun Java™ System Application Server documentation set.

## Application Server Documentation Set

The Application Server documentation set describes deployment planning and system installation. The Uniform Resource Locator (URL) for Application Server documentation is <http://docs.sun.com/coll/1343.4>. For an introduction to Application Server, refer to the books in the order in which they are listed in the following table.

**TABLE P-1** Books in the Application Server Documentation Set

Book Title	Description
<i>Documentation Center</i>	Application Server documentation topics organized by task and subject.
<i>Release Notes</i>	Late-breaking information about the software and the documentation. Includes a comprehensive, table-based summary of the supported hardware, operating system, Java Development Kit (JDK™), and database drivers.
<i>Quick Start Guide</i>	How to get started with the Application Server product.
<i>Installation Guide</i>	Installing the software and its components.
<i>Deployment Planning Guide</i>	Evaluating your system needs and enterprise to ensure that you deploy the Application Server in a manner that best suits your site. General issues and concerns that you must be aware of when deploying the server are also discussed.
<i>Application Deployment Guide</i>	Deployment of applications and application components to the Application Server. Includes information about deployment descriptors.

TABLE P-1 Books in the Application Server Documentation Set (Continued)

Book Title	Description
<i>Developer's Guide</i>	Creating and implementing Java Platform, Enterprise Edition (Java EE platform) applications intended to run on the Application Server that follow the open Java standards model for Java EE components and APIs. Includes information about developer tools, security, debugging, and creating lifecycle modules.
<i>Java EE 5 Tutorial</i>	Using Java EE 5 platform technologies and APIs to develop Java EE applications.
<i>Java WSIT Tutorial</i>	Developing web applications using the Web Service Interoperability Technologies (WSIT). Describes how, when, and why to use the WSIT technologies and the features and options that each technology supports.
<i>Administration Guide</i>	System administration for the Application Server, including configuration, monitoring, security, resource management, and web services management.
<i>High Availability Administration Guide</i>	Post-installation configuration and administration instructions for the high-availability database.
<i>Administration Reference</i>	Editing the Application Server configuration file, <code>domain.xml</code> .
<i>Upgrade and Migration Guide</i>	Upgrading from an older version of Application Server or migrating Java EE applications from competitive application servers. This guide also describes differences between adjacent product releases and configuration options that can result in incompatibility with the product specifications.
<i>Performance Tuning Guide</i>	Tuning the Application Server to improve performance.
<i>Troubleshooting Guide</i>	Solving Application Server problems.
<i>Error Message Reference</i>	Solving Application Server error messages.
<i>Reference Manual</i>	Utility commands available with the Application Server; written in man page style. Includes the <code>asadmin</code> command line interface.

## Related Documentation

Application Server can be purchased by itself or as a component of Sun Java Enterprise System (Java ES), a software infrastructure that supports enterprise applications distributed across a network or Internet environment. If you purchased Application Server as a component of Java ES, you should be familiar with the system documentation at <http://docs.sun.com/coll/1286.3>. The URL for all documentation about Java ES and its components is <http://docs.sun.com/prod/entsys.5>.

For documentation about other stand-alone Sun Java System server products, go to the following:

- [Message Queue documentation \(http://docs.sun.com/coll/1343.4\)](http://docs.sun.com/coll/1343.4)
- [Directory Server documentation \(http://docs.sun.com/coll/1224.1\)](http://docs.sun.com/coll/1224.1)
- [Web Server documentation \(http://docs.sun.com/coll/1308.3\)](http://docs.sun.com/coll/1308.3)

A Javadoc™ tool reference for packages provided with the Application Server is located at <http://glassfish.dev.java.net/nonav/javaee5/api/index.html>. Additionally, the following resources might be useful:

- The Java EE 5 Specifications (<http://java.sun.com/javaee/5/javatech.html>)
- The Java EE Blueprints (<http://java.sun.com/reference/blueprints/index.html>)

For information on creating enterprise applications in the NetBeans™ Integrated Development Environment (IDE), see <http://www.netbeans.org/kb/55/index.html>.

For information about the Java DB database included with the Application Server, see <http://developers.sun.com/javadb/>.

The GlassFish Samples project is a collection of sample applications that demonstrate a broad range of Java EE technologies. The GlassFish Samples are bundled with the Java EE Software Development Kit (SDK), and are also available from the GlassFish Samples project page at <https://glassfish-samples.dev.java.net/>.

# Default Paths and File Names

The following table describes the default paths and file names that are used in this book.

TABLE P-2 Default Paths and File Names

Placeholder	Description	Default Value
<i>as-install</i>	Represents the base installation directory for Application Server.	<p>Java ES installations on the Solaris™ operating system:</p> <p>/opt/SUNWappserver/appserver</p> <p>Java ES installations on the Linux operating system:</p> <p>/opt/sun/appserver/</p> <p>Other Solaris and Linux installations, non-root user:</p> <p><i>user's-home-directory</i>/SUNWappserver</p> <p>Other Solaris and Linux installations, root user:</p> <p>/opt/SUNWappserver</p> <p>Windows, all installations:</p> <p><i>SystemDrive</i>: \Sun\AppServer</p>

TABLE P-2 Default Paths and File Names (Continued)

Placeholder	Description	Default Value
<i>domain-root-dir</i>	Represents the directory containing all domains.	Java ES Solaris installations:  /var/opt/SUNWappserver/domains/  Java ES Linux installations:  /var/opt/sun/appserver/domains/  All other installations:  as-install/domains/
<i>domain-dir</i>	Represents the directory for a domain.  In configuration files, you might see <i>domain-dir</i> represented as follows:  \${com.sun.aas.instanceRoot}	<i>domain-root-dir/domain-dir</i>
<i>instance-dir</i>	Represents the directory for a server instance.	<i>domain-dir/instance-dir</i>

# Typographic Conventions

The following table describes the typographic changes that are used in this book.

TABLE P-3 Typographic Conventions

Typeface	Meaning	Example
AaBbCc123	The names of commands, files, and directories, and onscreen computer output	Edit your <code>.login</code> file.  Use <code>ls -a</code> to list all files.  machine_name% you have mail.
<b>AaBbCc123</b>	What you type, contrasted with onscreen computer output	machine_name% <b>su</b>  Password:
<i>AaBbCc123</i>	A placeholder to be replaced with a real name or value	The command to remove a file is <i>rm filename</i> .
<i>AaBbCc123</i>	Book titles, new terms, and terms to be emphasized (note that some emphasized items appear bold online)	Read Chapter 6 in the <i>User's Guide</i> .  A <i>cache</i> is a copy that is stored locally.  Do <i>not</i> save the file.

## Symbol Conventions

The following table explains symbols that might be used in this book.

TABLE P-4 Symbol Conventions

Symbol	Description	Example	Meaning
[ ]	Contains optional arguments and command options.	<code>ls [-l]</code>	The <code>-l</code> option is not required.
{   }	Contains a set of choices for a required command option.	<code>-d {y n}</code>	The <code>-d</code> option requires that you use either the <code>y</code> argument or the <code>n</code> argument.
<code>\${ }</code>	Indicates a variable reference.	<code>\${com.sun.javaRoot}</code>	References the value of the <code>com.sun.javaRoot</code> variable.
-	Joins simultaneous multiple keystrokes.	Control-A	Press the Control key while you press the A key.
+	Joins consecutive multiple keystrokes.	Ctrl+A+N	Press the Control key, release it, and then press the subsequent keys.
→	Indicates menu item selection in a graphical user interface.	File → New → Templates	From the File menu, choose New. From the New submenu, choose Templates.

## Documentation, Support, and Training

The Sun web site provides information about the following additional resources:

- Documentation (<http://www.sun.com/documentation/>)
- Support (<http://www.sun.com/support/>)
- Training (<http://www.sun.com/training/>)

## Searching Sun Product Documentation

Besides searching Sun product documentation from the docs.sun.com<sup>SM</sup> web site, you can use a search engine by typing the following syntax in the search field:

```
search-term site:docs.sun.com
```

For example, to search for “broker,” type the following:

```
broker site:docs.sun.com
```

To include other Sun web sites in your search (for example, [java.sun.com](http://java.sun.com), [www.sun.com](http://www.sun.com), and [developers.sun.com](http://developers.sun.com)), use `sun . com` in place of `docs . sun . com` in the search field.

## Third-Party Web Site References

Third-party URLs are referenced in this document and provide additional, related information.

---

**Note** – Sun is not responsible for the availability of third-party web sites mentioned in this document. Sun does not endorse and is not responsible or liable for any content, advertising, products, or other materials that are available on or through such sites or resources. Sun will not be responsible or liable for any actual or alleged damage or loss caused or alleged to be caused by or in connection with use of or reliance on any such content, goods, or services that are available on or through such sites or resources.

---

## Sun Welcomes Your Comments

Sun is interested in improving its documentation and welcomes your comments and suggestions. To share your comments, go to <http://docs.sun.com> and click Send Comments. In the online form, provide the full document title and part number. The part number is a 7-digit or 9-digit number that can be found on the book's title page or in the document's URL. For example, the part number of this book is 819-3674.

# The domain.xml File

---

This chapter describes the `domain.xml` configuration file in these sections:

- [“About the domain.xml File” on page 15](#)
- [“Alphabetical List of Elements” on page 21](#)

---

**Note** – Subelements must be defined in the order in which they are listed under each **Subelements** heading in this chapter unless otherwise noted.

---

## About the domain.xml File

The `domain.xml` file contains most of the Sun Java™ System Application Server configuration. The encoding is UTF-8 to maintain compatibility with regular UNIX text editors. The `domain.xml` file is located in the domain configuration directory, which is typically `domain-dir/config`. This file is further described in the following sections:

- [“The sun-domain\\_1\\_3.dtd File” on page 16](#)
- [“Default Values” on page 16](#)
- [“Variables” on page 16](#)
- [“Element Referencing” on page 18](#)
- [“Element Hierarchy” on page 18](#)

---

**Note** – Settings in the Application Server deployment descriptors override corresponding settings in the `domain.xml` file unless otherwise stated. For more information about the Application Server deployment descriptors, see the *Sun Java System Application Server 9.1 Application Deployment Guide*.

---

## The sun-domain\_1\_3.dtd File

The sun-domain\_1\_3.dtd file defines the structure of the domain.xml file, including the elements it can contain and the subelements and attributes these elements can have. The sun-domain\_1\_3.dtd file is located in the *as-install/lib/dtds* directory.

---

**Note** – Do not edit the sun-domain\_1\_3.dtd file; its contents change only with new versions of the Application Server.

The sun-domain\_1\_3.dtd interface is unstable. An unstable interface might be experimental or transitional, and hence might change incompatibly, be removed, or be replaced by a more stable interface in the next release.

Elements or attributes that appear in the sun-domain\_1\_3.dtd file but are not described in this chapter are not implemented and should not be used.

---

For general information about DTD files and XML, see the [XML specification](http://www.w3.org/TR/REC-xml) (<http://www.w3.org/TR/REC-xml>).

## Default Values

In this manual, the term *default* is used in its broader sense, and not in the specific way it is used in the XML 1.0 standard. A default value is an initial value or the value used if no value is present in the XML file. A default value can be any of the following:

- A value supplied by the XML parser when no value is found in the domain.xml file. The relevant element or attribute is optional.
- A value supplied by the Application Server when no value is found in the domain.xml file and the XML parser doesn't provide a value. The relevant element or attribute is optional.
- An initial value supplied when the domain.xml file is created. The relevant element or attribute might or might not be optional.

When a required attribute or property has a default, this default is supplied when the domain.xml file is created.

## Variables

Variables and variable references are needed for two reasons:

- Parts of the Application Server share much configuration information but differ in specific details. For example, server instances in a cluster typically share the same configuration except for their port numbers.

- Parts of the configuration come from the system environment but must still be captured in the configuration.

Variable references appear in the `domain.xml` file as strings that begin with the characters `${` and end with the character `}`. For example, the string `${com.sun.enterprise.myVar}` is a reference to the variable `com.sun.enterprise.myVar`.

Variables are defined both outside of and within `domain.xml`. Predefined variables that exist outside of `domain.xml` are defined as Java System Properties. Within `domain.xml`, a variable is defined using the “[system-property](#)” on page 136 element or the “[jvm-options](#)” on page 95 element.

The `system-property` element’s `name` attribute is the name of a variable; its `value` attribute is the definition of the variable. For example, the following `system-property` element defines a `port-number` variable with the value `6500`:

```
<system-property name="port-number" value="6500"/>
```

Multiple `system-property` subelements are permitted within “[server](#)” on page 129, “[cluster](#)” on page 35, “[config](#)” on page 38, and “[domain](#)” on page 51 elements.

A variable defined in the `jvm-options` element is a Java System Property with the `-D` flag. For example, the following `jvm-options` element defines a `port-number` variable with the value `5500`:

```
<jvm-option>-Dport-number=5500</jvm-option>
```

Multiple definitions for the same variable are permitted. The Application Server determines the actual value of a variable by searching for its first definition in a strict hierarchy of the elements within `domain.xml`. The hierarchy is as follows:

```
server → cluster → config → jvm-options → domain → System
```

Implicit in this hierarchy is the notion of reference and containment. A variable referenced in a `server` element is only looked up:

- In the `cluster` element referenced by that specific `server`
- In the `config` element that references that specific `server`
- In the `jvm-options` subelements of the `config` element referenced by that `server`

---

**Note** – Some topics in the documentation pertain to features that are available only in domains that are configured to support clusters. Examples of domains that support clusters are domains that are created with the cluster profile or the enterprise profile. For information about profiles, see “Usage Profiles” in *Sun Java System Application Server 9.1 Administration Guide*.

---

## Element Referencing

One element *references* another when an attribute of the referencing element has the same value as an attribute of the referenced element. For example, the “[application-ref](#)” on page 27 element references an application or module that is deployed to its parent “[server](#)” on page 129 element. The application-ref element’s ref attribute has the same value as the name attribute of a “[lifecycle-module](#)” on page 97, “[j2ee-application](#)” on page 80, “[ejb-module](#)” on page 56, “[web-module](#)” on page 152, “[connector-module](#)” on page 45, or “[appclient-module](#)” on page 26 element.

The referencing application-ref element might look like this:

```
<application-ref ref="MyServlet"/>
```

The referenced web-module element might look like this:

```
<web-module name="MyServlet" location="myservletdir"/>
```

## Element Hierarchy

The element hierarchy for the domain.xml file is as follows. To make the hierarchy more readable, elements having “[property](#)” on page 118 as their last or only subelement are marked with a P, and the property subelements are not shown. Parent/child relationships between elements are shown, but not cardinality. For those details, see the element descriptions.

```
domain      P
.   applications
.   .   lifecycle-module      P
.   .   .   description

## Alphabetical List of Elements

[“A” on page 22](#) [“B” on page 35](#) [“C” on page 35](#) [“D” on page 48](#) [“E” on page 53](#) [“F” on page 65](#)  
[“G” on page 66](#) [“H” on page 67](#) [“I” on page 78](#) [“J” on page 80](#) [“K” on page 95](#) [“L” on page 96](#)  
[“M” on page 103](#) [“N” on page 114](#) [“O” on page 115](#) [“P” on page 116](#) [“R” on page 122](#) [“S” on page 127](#)  
[“T” on page 138](#) [“U” on page 143](#) [“V” on page 143](#) [“W” on page 148](#)

A

access-log

Defines access log settings for each “http-access-log” on page 68 subelement of each “virtual-server” on page 143.

Superelements

“http-service” on page 75

Subelements

none

Attributes

The following table describes attributes for the access - log element.

TABLE 1-1 access - log Attributes

Attribute	Default	Description
format	%client.name% %auth-user-name% %datetime% %request% %status% %response.length%	(optional) Specifies the format of the access log. For a complete list of token values you can use in the format, see the online help for the Access Log tab of the HTTP Service page in the Admin Console.
rotation-policy	time	(optional) Specifies the condition that triggers log rotation. The only legal value is time, which rotates log files at the rotation-interval-in-minutes interval.
rotation-interval-in-minutes	15 (developer profile) 1440 (cluster and enterprise profiles)	(optional) Specifies the time interval between log rotations if rotation-policy is set to time.
rotation-suffix	yyyy-MM-dd (developer profile) yyyyMMdd-HH'h'mm'm'ss's' (cluster and enterprise profiles)	(optional) Specifies the format of the timestamp appended to the access log name when log rotation occurs.  For supported formats, see <a href="http://java.sun.com/j2se/1.5.0/docs/api/java/text/SimpleDateFormat.html">http://java.sun.com/j2se/1.5.0/docs/api/java/text/SimpleDateFormat.html</a> .  The following value is supported for backward compatibility. It results in the same format as the default.  %YYYY;%MM;%DD;-%hh;h:mm;m:ss;s
rotation-enabled	true	(optional) If true, enables log rotation.

## action

Specifies the action of a management rule. The action is implemented as an MBean.

### Superelements

[“management-rule” on page 105](#)

### Subelements

none

### Attributes

The following table describes attributes for the `action` element.

TABLE 1-2 `action` Attributes

Attribute	Default	Description
<code>action-mbean-name</code>	none	Specifies the name of the <a href="#">“mbean” on page 107</a> that performs the action of a management rule. This MBean must implement <code>javax.management.NotificationListener</code> .

## admin-object-resource

Defines an administered object for an inbound resource adapter.

### Superelements

[“resources” on page 125](#)

### Subelements

The following table describes subelements for the `admin-object-resource` element.

TABLE 1-3 `admin-object-resource` Subelements

Element	Required	Description
<a href="#">“description” on page 50</a>	zero or one	Contains a text description of this element.
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

### Attributes

The following table describes attributes for the `admin-object-resource` element.

TABLE 1-4 admin-object-resource Attributes

Attribute	Default	Description
jndi-name	none	Specifies the JNDI name for the resource.
res-type	none	Specifies the fully qualified type of the resource.
res-adapter	none	Specifies the name of the inbound resource adapter, as specified in the name attribute of a “connector-module” on page 45 element.
object-type	user	(optional) Defines the type of the resource. Allowed values are: <ul style="list-style-type: none"><li>■ system-all - A system resource for all server instances and the domain application server.</li><li>■ system-admin - A system resource only for the domain application server.</li><li>■ system-instance - A system resource for all server instances only.</li><li>■ user - A user resource.</li></ul>
enabled	true	(optional) Determines whether this resource is enabled at runtime.

Properties

Properties of the admin-object-resource element are the names of setter methods of the adminobject-class specified in the adminobject element of the ra.xml file. Some of the property names can be specified in the adminobject element itself. For example, in jmsra, the resource adapter used to communicate with the Sun Java System Message Queue software, jmsra, Name and Description are valid properties.

For a complete list of the available properties (called *administered object attributes* in the Message Queue software), see the *Sun Java System Message Queue 4.1 Administration Guide*.

admin-service

Determines whether the server instance is a regular instance, a domain administration server, or a combination.

Superelements

“config” on page 38

Subelements

The following table describes subelements for the admin-service element.

TABLE 1-5 admin-service Subelements

Element	Required	Description
<a href="#">“jmx-connector” on page 93</a>	zero or more	Configures a JSR 160/255 compliant remote JMX connector.
<a href="#">“das-config” on page 48</a>	only one (developer profile)  zero or one (cluster and enterprise profiles)	Defines a domain administration server configuration.
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

## Attributes

The following table describes attributes for the `admin-service` element.

TABLE 1-6 admin-service Attributes

Attribute	Default	Description
type	das-and-server (developer profile)  server (cluster and enterprise profiles)	Specifies whether the server instance is a regular instance ( <code>server</code> ), a domain administration server ( <code>das</code> ), or a combination ( <code>das-and-server</code> ). modifying this value is not recommended.
system-jmx-connector-name	none	Specifies the name of the internal <a href="#">“jmx-connector” on page 93</a> .

## alert-service

Configures the alert service, which allows you to register for and receive system status alerts.

## Superelements

[“config” on page 38](#)

## Subelements

The following table describes subelements for the `alert-service` element.

TABLE 1-7 alert-service Subelements

Element	Required	Description
<a href="#">“alert-subscription” on page 26</a>	zero or more	Configures a subscription to system status alerts.
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

# alert-subscription

Configures a subscription to system status alerts.

## Superelements

[“alert-service” on page 25](#)

## Subelements

The following table describes subelements for the alert-subscription element.

TABLE 1-8 alert-subscription Subelements

Element	Required	Description
<a href="#">“listener-config” on page 98</a>	only one	Configures the listener class that listens for alerts from notification emitters.
<a href="#">“filter-config” on page 65</a>	zero or one	Configures the filter class that filters alerts from notification emitters.

## Attributes

The following table describes attributes for the alert-subscription element.

TABLE 1-9 alert-subscription Attributes

Attribute	Default	Description
name	none	Specifies the name of this alert subscription.

# appclient-module

Specifies a deployed application client container (ACC) module.

## Superelements

[“applications” on page 28](#)

## Subelements

The following table describes subelements for the `appclient-module` element.

TABLE 1-10 `appclient-module` Subelements

Element	Required	Description
<a href="#">“description” on page 50</a>	zero or one	Contains a text description of this element.
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

## Attributes

The following table describes attributes for the `appclient-module` element.

TABLE 1-11 `appclient-module` Attributes

Attribute	Default	Description
<code>name</code>	<code>none</code>	The name of the ACC module.
<code>location</code>	<code>none</code>	The location of the ACC module in the Application Server file system.
<code>directory-deployed</code>	<code>false</code>	(optional) Specifies whether the application has been deployed as a directory.
<code>java-web-start-enabled</code>	<code>true</code>	(optional) Specifies whether Java Web Start access is permitted for this application client.

## application-ref

References an application or module deployed to the server instance or cluster.

---

**Note** – Some topics in the documentation pertain to features that are available only in domains that are configured to support clusters. Examples of domains that support clusters are domains that are created with the cluster profile or the enterprise profile. For information about profiles, see “Usage Profiles” in *Sun Java System Application Server 9.1 Administration Guide*.

---

## Superelements

[“cluster” on page 35](#), [“server” on page 129](#)

## Subelements

none

## Attributes

The following table describes attributes for the `application-ref` element.

TABLE 1-12 application-ref Attributes

Attribute	Default	Description
<code>enabled</code>	<code>true</code>	(optional) Determines whether the application or module is enabled.
<code>virtual-servers</code>	all virtual servers	(optional) In a comma-separated list, references <code>id</code> attributes of the <a href="#">“virtual-server” on page 143</a> elements to which the <a href="#">“web-module” on page 152</a> or the web modules within this <a href="#">“j2ee-application” on page 80</a> are deployed.
<code>lb-enabled</code>	<code>false</code>	(optional) If <code>true</code> , all load-balancers that reference this application consider it available to them.
<code>disable-timeout-in-minutes</code>	30	(optional) Specifies the time it takes this application to reach a quiescent state after having been disabled.
<code>ref</code>	none	References the name attribute of a <a href="#">“lifecycle-module” on page 97</a> , <a href="#">“j2ee-application” on page 80</a> , <a href="#">“ejb-module” on page 56</a> , <a href="#">“web-module” on page 152</a> , <a href="#">“connector-module” on page 45</a> , <a href="#">“appclient-module” on page 26</a> , or <a href="#">“extension-module” on page 63</a> element.

## applications

Contains deployed Java EE applications, Java EE modules, and Lifecycle modules.

### Superelements

[“domain” on page 51](#)

### Subelements

The following table describes subelements for the `applications` element.

TABLE 1-13 applications Subelements

Element	Required	Description
<a href="#">“lifecycle-module” on page 97</a>	zero or more	Specifies a deployed lifecycle module.
<a href="#">“j2ee-application” on page 80</a>	zero or more	Specifies a deployed Java EE application.
<a href="#">“ejb-module” on page 56</a>	zero or more	Specifies a deployed EJB module.
<a href="#">“web-module” on page 152</a>	zero or more	Specifies a deployed web module.
<a href="#">“connector-module” on page 45</a>	zero or more	Specifies a deployed connector module.
<a href="#">“appclient-module” on page 26</a>	zero or more	Specifies a deployed application client container (ACC) module.

TABLE 1-13 applications Subelements (Continued)

Element	Required	Description
<a href="#">“mbean” on page 107</a>	zero or more	Specifies an MBean.
<a href="#">“extension-module” on page 63</a>	zero or more	Specifies an extension module.

---

**Note** – Subelements of an `applications` element can occur in any order.

---

## audit-module

Specifies an optional plug-in module that implements audit capabilities.

### Superelements

[“security-service” on page 128](#)

### Subelements

The following table describes subelements for the `audit-module` element.

TABLE 1-14 audit-module Subelements

Element	Required	Description
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

### Attributes

The following table describes attributes for the `audit-module` element.

TABLE 1-15 audit-module Attributes

Attribute	Default	Description
<code>name</code>	<code>default</code>	Specifies the name of this audit module.
<code>classname</code>	<code>com.sun.enterprise.security.Audit</code>	Specifies the Java class that implements this audit module.

## auth-realm

Defines a realm for authentication.

Authentication realms require provider-specific properties, which vary depending on what a particular implementation needs.

For more information about how to define realms, see the *Sun Java System Application Server 9.1 Administration Guide*.

Here is an example of the default file realm:

```
<auth-realm name="file"
  classname="com.sun.enterprise.security.auth.realm.file.FileRealm">
  <property name="file" value="domain-dir/config/keyfile"/>
  <property name="jaas-context" value="fileRealm"/>
</auth-realm>
```

Which properties an auth-realm element uses depends on the value of the auth-realm element's name attribute. The file realm uses file and jaas-context properties. Other realms use different properties.

Superelements

[“node-agent” on page 114](#), [“security-service” on page 128](#)

Subelements

The following table describes subelements for the auth-realm element.

TABLE 1-16 auth-realm Subelements

Element	Required	Description
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

Attributes

The following table describes attributes for the auth-realm element.

TABLE 1-17 auth-realm Attributes

Attribute	Default	Description
name	none	Specifies the name of this realm.
classname	none	Specifies the Java class that implements this realm.

Properties

The standard realms provided with Application Server have required and optional properties. A custom realm might have different properties.

The following table describes properties for the auth-realm element.

TABLE 1-18 auth-realm Properties

Property	Realms	Description
jaas-context	file, ldap, jdbc, solaris	Specifies the JAAS (Java Authentication and Authorization Service) context.
file	file	Specifies the file that stores user names, passwords, and group names. The default is <i>domain-dir/config/keyfile</i> .
assign-groups	certificate, file, jdbc, ldap, solaris	(optional) If this property is set, its value is taken to be a comma-separated list of group names. All clients who present valid certificates are assigned membership to these groups for the purposes of authorization decisions in the web and EJB containers.
directory	ldap	Specifies the LDAP URL to your server.
base-dn	ldap	Specifies the LDAP base DN for the location of user data. This base DN can be at any level above the user data, since a tree scope search is performed. The smaller the search tree, the better the performance.
search-filter	ldap	(optional) Specifies the search filter to use to find the user. The default is <code>uid=%s</code> (%s expands to the subject name).
group-base-dn	ldap	(optional) Specifies the base DN for the location of groups data. By default, it is same as the <code>base-dn</code> , but it can be tuned, if necessary.
group-search-filter	ldap	(optional) Specifies the search filter to find group memberships for the user. The default is <code>uniquemember=%d</code> (%d expands to the user element DN).
group-target	ldap	(optional) Specifies the LDAP attribute name that contains group name entries. The default is CN.
search-bind-dn	ldap	(optional) Specifies an optional DN used to authenticate to the directory for performing the <code>search-filter</code> lookup. Only required for directories that do not allow anonymous search.
search-bind-password	ldap	(optional) Specifies the LDAP password for the DN given in <code>search-bind-dn</code> .
datasource-jndi	jdbc	Specifies the <code>jndi-name</code> of the “ <a href="#">jdbc-resource</a> ” on <a href="#">page 88</a> for the database.
user-table	jdbc	Specifies the name of the user table in the database.
user-name-column	jdbc	Specifies the name of the user name column in the database's user table.
password-column	jdbc	Specifies the name of the password column in the database's user table.
group-table	jdbc	Specifies the name of the group table in the database.
group-name-column	jdbc	Specifies the name of the group name column in the database's group table.
db-user	jdbc	(optional) Allows you to specify the database user name in the realm instead of the “ <a href="#">jdbc-connection-pool</a> ” on <a href="#">page 84</a> . This prevents other applications from looking up the database, getting a connection, and browsing the user table. By default, the <code>jdbc-connection-pool</code> configuration is used.

TABLE 1-18 auth-realm Properties (Continued)

Property	Realms	Description
db-password	jdbc	(optional) Allows you to specify the database password in the realm instead of the “jdbc-connection-pool” on page 84. This prevents other applications from looking up the database, getting a connection, and browsing the user table. By default, the jdbc-connection-pool configuration is used.
digest-algorithm	jdbc	(optional) Specifies the digest algorithm. The default is MD5. You can use any algorithm supported in the JDK, or none.
encoding	jdbc	(optional) Specifies the encoding. Allowed values are Hex and Base64. If digest-algorithm is specified, the default is Hex. If digest-algorithm is not specified, by default no encoding is specified.
charset	jdbc	(optional) Specifies the charset for the digest algorithm.

## availability-service

Configures the availability service. Enables high-availability features, such as HTTP session state and stateful session bean state persistence. If the Sun Java System high-availability database (HADB) is installed and you have selected the enterprise profile, session state is persisted to the HADB.

**Note** – Some topics in the documentation pertain to features that are available only in domains that are configured to support clusters. Examples of domains that support clusters are domains that are created with the cluster profile or the enterprise profile. For information about profiles, see “Usage Profiles” in *Sun Java System Application Server 9.1 Administration Guide*.

Availability can be enabled or disabled at the following levels:

1. The server instance (attribute of availability-service). Default is true (enabled).
2. The EJB or web container (attribute of “ejb-container-availability” on page 55 or “web-container-availability” on page 149). Default is true (enabled).
3. The application (attribute of “j2ee-application” on page 80). Default is false (disabled).
4. The stand-alone EJB or web module (attribute of “ejb-module” on page 56 or “web-module” on page 152). Default is false (disabled).
5. The stateful session bean. Default is false (disabled). See the *Sun Java System Application Server 9.1 Developer’s Guide*.

For availability to be enabled at a given level, it must be enabled at all higher levels, as well. For example, to enable availability at the application level, you must also enable it at the server instance and container levels.

If the HADB is installed and the enterprise profile is selected, availability can also be enabled in the Java Message Service (attribute of “[jms-availability](#)” on page 89). The default is `false` (disabled). JMS availability is disabled if server instance availability is disabled. JMS availability neither affects nor is affected by any other availability levels.

## Superelements

“[config](#)” on page 38

## Subelements

The following table describes subelements for the `availability-service` element.

TABLE 1-19 `availability-service` Subelements

Element	Required	Description
“ <a href="#">web-container-availability</a> ” on page 149	zero or one	Enables availability in the web container.
“ <a href="#">ejb-container-availability</a> ” on page 55	zero or one	Enables availability in the EJB container.
“ <a href="#">jms-availability</a> ” on page 89	zero or one	Enables availability in the Java Message Service.
“ <a href="#">property</a> ” on page 118	zero or more	Specifies a property or a variable.

## Attributes

The following table describes attributes for the `availability-service` element.

TABLE 1-20 `availability-service` Attributes

Attribute	Default	Description
<code>availability-enabled</code>	<code>true</code>	(optional) If set to <code>true</code> , high-availability features apply to all applications deployed to the server instance that do not have availability disabled. All instances in a cluster should have the same availability value to ensure consistent behavior.
<code>ha-agent-hosts</code>	<code>none</code>	Specifies a comma-separated list of server host names or IP addresses where management agents for the high availability store are running. Applicable if HADB is installed and you have selected the enterprise profile.
<code>ha-agent-port</code>	<code>none</code>	Specifies the port number where management agents for the high availability store can be contacted. Applicable if HADB is installed and you have selected the enterprise profile.
<code>ha-agent-password</code>	<code>asadmin password</code>	Specifies the password for access to management agents for the high availability store. Applicable if HADB is installed and you have selected the enterprise profile.

TABLE 1-20 availability-service Attributes (Continued)

Attribute	Default	Description
ha-store-name	cluster name	(optional) Specifies the HADB database name. Applicable if HADB is installed and you have selected the enterprise profile.
auto-manage-ha-store	true	(optional) If true, the life cycle of the highly available store is matched with the life cycle of the highly available cluster. The store is started or stopped with the cluster. It is removed when the cluster is deleted. If false, the store life cycle must be manually managed by the administrator. Applicable if HADB is installed and you have selected the enterprise profile.
store-pool-name	jdbc/hastore	(optional) Specifies the jndi-name of the “jdbc-resource” on page 88 used for connections to the HADB for session persistence. Applicable if HADB is installed and you have selected the enterprise profile.  For more information about setting up a connection pool and JDBC resource for the HADB, see the description of the <code>configure-ha-cluster</code> command in the <i>Sun Java System Application Server 9.1 Reference Manual</i> .
ha-store-healthcheck-enabled	false	(optional) If true, periodic checking is done to detect if the HADB has become available again after a failure. If the health check succeeds, persistence to the HADB is resumed. Applicable if HADB is installed and you have selected the enterprise profile.
ha-store-healthcheck-interval-in-seconds	5	(optional) Specifies the interval at which the HADB's health is checked. The checking begins only after a failure is detected. Applicable if HADB is installed and you have selected the enterprise profile.

## Properties

The following table describes properties for the `availability-service` element. For more information about replicated session persistence, see “[web-container-availability](#)” on page 149 and “[ejb-container-availability](#)” on page 55.

TABLE 1-21 availability-service Properties

Attribute	Default	Description
replication_measurement_enabled	false	<p>If true, logs measurements of replication times.</p> <p>One of these messages appears in the sending instance's log:</p> <pre>messageSendSucceeded: id = session-id fastAckTime = 8 to partner: instance-name messageSendFailed: id = session-id fastAckTime = 8 to partner: instance-name</pre> <p>This message appears in the receiving instance's log:</p> <pre>messageReceiptSucceeded: bulkId = 1 receiptTime = 12 from partner: instance-name</pre>

TABLE 1-21 availability-service Properties (Continued)

Attribute	Default	Description
replication_measurement_interval	1	Specifies the frequency of measurement of replication. It must be a positive integer: 1 means every replication, 2 means once every 2 replications, 3 means once every 3 replications, and so on. Applicable only if replication_measurement_enabled is set to true.

## B

### backend-principal

Specifies the user name and password required by the Enterprise Information System (EIS).

#### Superelements

[“security-map” on page 127](#)

#### Subelements

none

#### Attributes

The following table describes attributes for the backend-principal element.

TABLE 1-22 backend-principal Attributes

Attribute	Default	Description
user-name	none	Specifies the user name required by the EIS.
password	none	(optional) Specifies the password required by the EIS, if any.

## C

### cluster

Defines a cluster.

**Note** – Some topics in the documentation pertain to features that are available only in domains that are configured to support clusters. Examples of domains that support clusters are domains that are created with the cluster profile or the enterprise profile. For information about profiles, see “Usage Profiles” in *Sun Java System Application Server 9.1 Administration Guide*.

## Superelements

[“clusters” on page 38](#)

## Subelements

The following table describes subelements for the `cluster` element.

TABLE 1–23 `cluster` Subelements

Element	Required	Description
<a href="#">“server-ref” on page 130</a>	zero or more	References a server instance that belongs to the cluster.
<a href="#">“resource-ref” on page 124</a>	zero or more	References a resource deployed to the cluster.
<a href="#">“application-ref” on page 27</a>	zero or more	References an application or module deployed to the cluster.
<a href="#">“system-property” on page 136</a>	zero or more	Specifies a system property.
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

## Attributes

The following table describes attributes for the `cluster` element.

TABLE 1–24 `cluster` Attributes

Attribute	Default	Description
<code>name</code>	<code>none</code>	Specifies the name of the cluster.
<code>config-ref</code>	default “ <a href="#">config</a> ” on <a href="#">page 38</a> element’s <code>name</code> attribute value, <code>server-config</code>	References the configuration used by the cluster.
<code>heartbeat-port</code>	<code>none</code> ; value automatically generated	Specifies the communication port the Group Management Service uses to listen for group events. Must be a valid port number.

TABLE 1-24 cluster Attributes (Continued)

Attribute	Default	Description
heartbeat-address	none; value automatically generated	Specifies the address the Group Management Service uses to listen for group events. Must be a multicast address.
heartbeat-enabled	false (developer profile) true (cluster and enterprise profiles)	(optional) If true, the Group Management Service is started as a lifecycle module in each server instance in the cluster and in the Domain Administration Server. The Domain Administration Server participates in each cluster that has this attribute set to true.

## cluster-ref

References a cluster.

**Note** – Some topics in the documentation pertain to features that are available only in domains that are configured to support clusters. Examples of domains that support clusters are domains that are created with the cluster profile or the enterprise profile. For information about profiles, see “Usage Profiles” in *Sun Java System Application Server 9.1 Administration Guide*.

## Superelements

[“lb-config” on page 96](#)

## Subelements

The following table describes subelements for the cluster-ref element.

TABLE 1-25 cluster-ref Subelements

Element	Required	Description
<a href="#">“health-checker” on page 67</a>	zero or one	Defines a health checker for the referenced cluster.

## Attributes

The following table describes attributes for the cluster-ref element.

TABLE 1-26 cluster-ref Attributes

Attribute	Default	Description
ref	none	References the name attribute of a <a href="#">“cluster” on page 35</a> element.

TABLE 1-26 cluster-ref Attributes (Continued)

Attribute	Default	Description
lb-policy	round-robin	(optional) Specifies the load balancing policy. Allowed values are: <ul style="list-style-type: none"><li>■ round-robin — The load balancer cycles through the cluster’s server instances in a specified order.</li><li>■ weighted-round-robin — The load balancer cycles through the server instances in a specified order, but routes more requests to instances with greater processing capacity. Processing capacity is represented by values of the lb-weight attribute of each “server” on page 129 element referenced by the cluster.</li><li>■ user-defined — The load balancing policy is defined in a custom module.</li></ul>
lb-policy-module	none	(optional) Specifies the absolute path to the shared library that implements the user-defined policy. The shared library must exist and be readable on the machine where the load balancer is running.  Required only if lb-policy is set to user-defined.

## clusters

Contains clusters.

### Superelements

“domain” on page 51

### Subelements

The following table describes subelements for the clusters element.

TABLE 1-27 clusters Subelements

Element	Required	Description
“cluster” on page 35	zero or more	Defines a cluster.

## config

Defines a configuration, which is a collection of settings that controls how a server instance functions.

### Superelements

“configs” on page 40

## Subelements

The following table describes subelements for the `config` element.

TABLE 1–28 `config` Subelements

Element	Required	Description
<a href="#">“http-service” on page 75</a>	only one	Configures the HTTP service.
<a href="#">“iiop-service” on page 79</a>	only one	Configures the IIOP service.
<a href="#">“admin-service” on page 24</a>	only one	Determines whether the server to which the configuration applies is an administration server.
<a href="#">“connector-service” on page 47</a>	zero or one	Configures the connector service.
<a href="#">“web-container” on page 148</a>	only one	Configures the web container.
<a href="#">“ejb-container” on page 53</a>	only one	Configures the Enterprise JavaBeans™ (EJB™) container.
<a href="#">“mdb-container” on page 108</a>	only one	Configures the message-driven bean (MDB) container.
<a href="#">“jms-service” on page 91</a>	zero or one	Configures the Java Message Service (JMS) provider.
<a href="#">“log-service” on page 101</a>	only one	Configures the system logging service.
<a href="#">“security-service” on page 128</a>	only one	Configures the Java EE security service.
<a href="#">“transaction-service” on page 139</a>	only one	Configures the transaction service.
<a href="#">“monitoring-service” on page 113</a>	only one	Configures the monitoring service.
<a href="#">“diagnostic-service” on page 50</a>	zero or one	Configures the diagnostic service.
<a href="#">“java-config” on page 82</a>	only one	Configures the Java Virtual Machine (JVM™).
<a href="#">“availability-service” on page 32</a>	zero or one	Configures the availability service.
<a href="#">“thread-pools” on page 139</a>	only one	Configures thread pools.
<a href="#">“alert-service” on page 25</a>	zero or one	Configures the alert service.
<a href="#">“group-management-service” on page 66</a>	zero or one	Configures the group management service.
<a href="#">“management-rules” on page 106</a>	zero or one	Configures self-management rules.
<a href="#">“system-property” on page 136</a>	zero or more	Specifies a system property.
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

## Attributes

The following table describes attributes for the `config` element.

TABLE 1–29 config Attributes

Attribute	Default	Description
name	server-config (for default instance)	Specifies the name of the configuration.
dynamic-reconfiguration-enabled	true	(optional) If <code>true</code> , any changes to the system (for example, applications deployed, resources created) are automatically applied to the affected servers without a restart being required. If <code>false</code> , such changes are only picked up by the affected servers when each server restarts.

## configs

Contains configurations.

### Superelements

[“domain” on page 51](#)

### Subelements

The following table describes subelements for the `configs` element.

TABLE 1–30 configs Subelements

Element	Required	Description
<a href="#">“config” on page 38</a>	only one (developer profile)  one or more (cluster and enterprise profiles)	Defines a configuration.

## connection-pool

Defines a pool of client HTTP connections used by the [“http-listener” on page 70](#) subelements of the parent [“http-service” on page 75](#) element.

### Superelements

[“http-service” on page 75](#)

### Subelements

none

## Attributes

The following table describes attributes for the `connection-pool` element.

TABLE 1-31 `connection-pool` Attributes

Attribute	Default	Description
<code>queue-size-in-bytes</code>	4096	(optional) Specifies the size in bytes of the connection queue for “ <a href="#">http-listener</a> ” on page 70 elements.
<code>max-pending-count</code>	4096	(optional) Specifies the maximum number of pending connections on an “ <a href="#">http-listener</a> ” on page 70.
<code>receive-buffer-size-in-bytes</code>	4096	(optional) Specifies the size of the receive buffer for all “ <a href="#">http-listener</a> ” on page 70 elements.
<code>send-buffer-size-in-bytes</code>	8092	(optional) Specifies the size of the send buffer for all “ <a href="#">http-listener</a> ” on page 70 elements.

## connector-connection-pool

Defines a connector connection pool.

## Superelements

“[resources](#)” on page 125

## Subelements

The following table describes subelements for the `connector-connection-pool` element.

TABLE 1-32 `connector-connection-pool` Subelements

Element	Required	Description
“ <a href="#">description</a> ” on page 50	zero or one	Contains a text description of this element.
“ <a href="#">security-map</a> ” on page 127	zero or more	Maps the principal received during servlet or EJB authentication to the credentials accepted by the EIS.
“ <a href="#">property</a> ” on page 118	zero or more	Specifies a property or a variable.

## Attributes

The following table describes attributes for the `connector-connection-pool` element. Changing the following attributes requires a server restart: `resource-adapter-name`, `connection-definition-name`, `transaction-support`, `associate-with-thread`, `lazy-connection-association`, and `lazy-connection-enlistment`.

TABLE 1-33 connector-connection-pool Attributes

Attribute	Default	Description
name	none	Specifies the name of the connection pool. A “ <a href="#">connector-resource</a> ” on <a href="#">page 46</a> element’s pool-name attribute refers to this name.
resource-adapter-name	none	Specifies the name attribute of the deployed “ <a href="#">connector-module</a> ” on <a href="#">page 45</a> . If no name is specified during deployment, the name of the .rar file is used. If the resource adapter is embedded in an application, then it is <i>app_name#rar_name</i> .
connection-definition-name	none	Specifies a unique name, identifying a resource adapter’s connection-definition element in the ra.xml file. This is usually the connectionfactory-interface of the connection-definition element.
steady-pool-size	8	(optional) Specifies the initial and minimum number of connections maintained in the pool.
max-pool-size	32	(optional) Specifies the maximum number of connections that can be created to satisfy client requests.
max-wait-time-in-millis	60000	(optional) Specifies the amount of time, in milliseconds, that the caller is willing to wait for a connection. If 0, the caller is blocked indefinitely until a resource is available or an error occurs.
pool-resize-quantity	2	(optional) Specifies the number of idle connections to be destroyed if the existing number of connections is above the steady-pool-size (subject to the max-pool-size limit).  This is enforced periodically at the idle-timeout-in-seconds interval. An idle connection is one that has not been used for a period of idle-timeout-in-seconds. When the pool size reaches steady-pool-size, connection removal stops.
idle-timeout-in-seconds	300	(optional) Specifies the maximum time that a connection can remain idle in the pool. After this amount of time, the pool can close this connection.
fail-all-connections	false	(optional) If true, closes all connections in the pool if a single validation check fails.
transaction-support	none	(optional) Specifies the transaction support for this connection pool. Overrides the transaction support defined in the resource adapter in a downward compatible way: supports a transaction level lower than or equal to the resource adapter’s, but not higher. Allowed values in descending order are: <ul style="list-style-type: none"> <li>■ XATransaction - Supports distributed transactions.</li> <li>■ LocalTransaction - Supports local transactions only.</li> <li>■ NoTransaction - No transaction support.</li> </ul>
is-connection-validation-required	false	(optional) Specifies whether connections have to be validated before being given to the application. If a resource’s validation fails, it is destroyed, and a new resource is created and returned.
connection-leak-timeout-in-seconds	0	Detects potential connection leaks by the application. A connection that is not returned back to the pool by the application within the specified period is assumed to be potentially leaking, and a stack trace of the caller is logged. A zero value disables leak detection. A nonzero value enables leak tracing.

TABLE 1-33 connector-connection-pool Attributes (Continued)

Attribute	Default	Description
connection-leak-reclaim	false	If true, the pool will reclaim a connection after connection-leak-timeout-in-seconds occurs.
connection-creation-retry-attempts	0	Specifies the number of attempts to create a new connection.
connection-creation-retry-interval-in-seconds	10	Specifies the time interval between attempts to create a connection when connection-creation-retry-attempts is greater than 0.
validate-atmost-once-period-in-seconds	60	Specifies the time interval within which a connection is validated at most once. Minimizes the number of validation calls.
lazy-connection-enlistment	false	If true, a connection is not enlisted in a transaction until it is used. If false, any connection object available to a transaction is enlisted in the transaction.
lazy-connection-association	false	If true, a physical connection is not associated with a logical connection until it is used. If false, a physical connection is associated with a logical connection even before it is used.
associate-with-thread	false	If true, allows a connection to be saved as a ThreadLocal in the calling thread. This connection gets reclaimed only when the calling thread dies or when the calling thread is not in use and the pool has run out of connections.
match-connections	true	If true, enables connection matching. You can set to false if connections are homogeneous.
max-connection-usage-count	0	Specifies the number of times a connections is reused by the pool, after which it is closed. A zero value disables this feature.

## Properties

Most properties of the `connector-connection-pool` element are the names of setter methods of the `managedconnectionfactory-class` element in the `ra.xml` file. Properties of the `connector-connection-pool` element override the `ManagedConnectionFactory` JavaBean configuration settings.

All but the last four properties in the following table are `connector-connection-pool` properties of `jmsra`, the resource adapter used to communicate with the Sun Java System Message Queue software. For a complete list of the available properties (called *administered object attributes* in the Message Queue software), see the *Sun Java System Message Queue 4.1 Administration Guide*.

Changes to `connector-connection-pool` properties require a server restart.

TABLE 1-34 connector-connection-pool Properties

Property	Default	Description
AddressList	none	Specifies a list of host/port combinations of the Message Queue software. For JMS resources of the Type <code>javax.jms.TopicConnectionFactory</code> or <code>javax.jms.QueueConnectionFactory</code> .
ClientId	none	Specifies the JMS Client Identifier to be associated with a Connection created using the <code>createTopicConnection</code> method of the <code>TopicConnectionFactory</code> class. For JMS resources of the Type <code>javax.jms.TopicConnectionFactory</code> .  Durable subscription names are unique and only valid within the scope of a client identifier. To create or reactivate a durable subscriber, the connection must have a valid client identifier. The JMS specification ensures that client identifiers are unique and that a given client identifier is allowed to be used by only one active connection at a time.
UserName	guest	Specifies the user name for connecting to the Message Queue software. For JMS resources of the Type <code>javax.jms.TopicConnectionFactory</code> or <code>javax.jms.QueueConnectionFactory</code> .
Password	guest	Specifies the password for connecting to the Message Queue software. For JMS resources of the Type <code>javax.jms.TopicConnectionFactory</code> or <code>javax.jms.QueueConnectionFactory</code> .
ReconnectAttempts	6	Specifies the number of attempts to connect (or reconnect) for each address in the <code>imqAddressList</code> before the client runtime moves on to try the next address in the list. A value of -1 indicates that the number of reconnect attempts is unlimited (the client runtime attempts to connect to the first address until it succeeds).
ReconnectInterval	30000	Specifies the interval between reconnect attempts in milliseconds. This applies to attempts on each address in the <code>imqAddressList</code> and on successive addresses in the list. If too short, this time interval does not give a broker time to recover. If too long, the reconnect might represent an unacceptable delay.
ReconnectEnabled	false	If true, specifies that the client runtime attempts to reconnect to a message server (or the list of addresses in <code>imqAddressList</code> ) when a connection is lost.
AddressListBehavior	priority	Specifies whether connection attempts are in the order of addresses in the <code>imqAddressList</code> attribute ( <code>priority</code> ) or in a random order ( <code>random</code> ). If many clients are attempting a connection using the same connection factory, use a random order to prevent them from all being connected to the same address.
AddressListIterations	-1	Specifies the number of times the client runtime iterates through the <code>imqAddressList</code> in an effort to establish (or reestablish) a connection. A value of -1 indicates that the number of attempts is unlimited.
LazyConnectionEnlistment	false	Deprecated. Use the equivalent attribute.
LazyConnectionAssociation	false	Deprecated. Use the equivalent attribute.

TABLE 1-34 connector-connection-pool Properties (Continued)

Property	Default	Description
AssociateWithThread	false	Deprecated. Use the equivalent attribute.
MatchConnections	true	Deprecated. Use the equivalent attribute.

---

**Note** – All JMS administered object resource properties that worked with version 7 of the Application Server are supported for backward compatibility.

---

## connector-module

Specifies a deployed connector module.

### Superelements

[“applications” on page 28](#)

### Subelements

The following table describes subelements for the `connector-module` element.

TABLE 1-35 connector-module Subelements

Element	Required	Description
<a href="#">“description” on page 50</a>	zero or one	Contains a text description of this element.
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

### Attributes

The following table describes attributes for the `connector-module` element.

TABLE 1-36 connector-module Attributes

Attribute	Default	Description
name	none	The name of the connector module.
location	none	The location of the connector module in the Application Server file system.

TABLE 1-36 connector-module Attributes (Continued)

Attribute	Default	Description
object-type	user	(optional) Defines the type of the resource. Allowed values are: <ul style="list-style-type: none"><li>■ system-all - A system resource for all server instances and the domain application server.</li><li>■ system-admin - A system resource only for the domain application server.</li><li>■ system-instance - A system resource for all server instances only.</li><li>■ user - A user resource.</li></ul>
enabled	true	(optional) Determines whether the connector module is enabled.
directory-deployed	false	(optional) Specifies whether the application has been deployed as a directory.

## connector-resource

Defines the connection factory object of a specific connection definition in a connector (resource adapter).

### Superelements

[“resources” on page 125](#)

### Subelements

The following table describes subelements for the connector - resource element.

TABLE 1-37 connector - resource Subelements

Element	Required	Description
<a href="#">“description” on page 50</a>	zero or one	Contains a text description of this element.
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

### Attributes

The following table describes attributes for the connector - resource element.

TABLE 1-38 connector - resource Attributes

Attribute	Default	Description
jndi-name	none	Specifies the JNDI name for the resource.

TABLE 1-38 connector-resource Attributes (Continued)

Attribute	Default	Description
pool-name	none	Specifies the name of the associated connector connection pool, defined in a <a href="#">“connector-connection-pool”</a> on page 41 element.
object-type	user	(optional) Defines the type of the resource. Allowed values are: <ul style="list-style-type: none"> <li>■ system-all - A system resource for all server instances and the domain application server.</li> <li>■ system-admin - A system resource only for the domain application server.</li> <li>■ system-instance - A system resource for all server instances only.</li> <li>■ user - A user resource.</li> </ul>
enabled	true	(optional) Determines whether this resource is enabled at runtime.

## connector-service

Configures the connector service.

### Superelements

[“config”](#) on page 38

### Subelements

none

### Attributes

The following table describes attributes for the connector-service element.

TABLE 1-39 connector-service Attributes

Attribute	Default	Description
shutdown-timeout-in-seconds	30	(optional) Specifies the maximum time allowed during application server shutdown for the <code>ResourceAdapter.stop()</code> method of a connector module's instance to complete. Resource adapters that take longer to shut down are ignored, and Application Server shutdown continues.

## custom-resource

Defines a custom resource, which specifies a custom server-wide resource object factory. Such object factories implement the `javax.naming.spi.ObjectFactory` interface.

## Superelements

[“resources” on page 125](#)

## Subelements

The following table describes subelements for the custom- resource element.

TABLE 1–40 custom- resource Subelements

Element	Required	Description
<a href="#">“description” on page 50</a>	zero or one	Contains a text description of this element.
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

## Attributes

The following table describes attributes for the custom- resource element.

TABLE 1–41 custom- resource Attributes

Attribute	Default	Description
jndi-name	none	Specifies the JNDI name for the resource.
res-type	none	Specifies the fully qualified type of the resource.
factory-class	none	Specifies the fully qualified name of the user-written factory class, which implements <code>javax.naming.spi.ObjectFactory</code> .
object-type	user	(optional) Defines the type of the resource. Allowed values are: <ul style="list-style-type: none"><li>▪ <code>system-all</code> - A system resource for all server instances and the domain application server.</li><li>▪ <code>system-admin</code> - A system resource only for the domain application server.</li><li>▪ <code>system-instance</code> - A system resource for all server instances only.</li><li>▪ <code>user</code> - A user resource.</li></ul>
enabled	true	(optional) Determines whether this resource is enabled at runtime.

# D

## das-config

Defines a domain administration server configuration. The domain administration server runs the Administration Console.

## Superelements

[“admin-service” on page 24](#)

## Subelements

The following table describes subelements for the `das-config` element.

TABLE 1–42 `das-config` Subelements

Element	Required	Description
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

## Attributes

The following table describes attributes for the `das-config` element. For more information about deployment topics such as dynamic reloading and autodeployment, see the *Sun Java System Application Server 9.1 Developer’s Guide*.

TABLE 1–43 `das-config` Attributes

Attribute	Default	Description
<code>dynamic-reload-enabled</code>	<code>false</code>	(optional) If <code>true</code> , checks the timestamp on a <code>.reload</code> file at every module and application directory level, to trigger dynamic reloading.
<code>dynamic-reload-poll-interval-in-seconds</code>	<code>2</code>	(optional) Controls the polling frequency of dynamic reloading.
<code>autodeploy-enabled</code>	<code>false</code>	(optional) If <code>true</code> , enables autodeployment, which lets you quickly deploy applications and modules to a running Application Server without performing an explicit server instance restart or a separate deployment operation.
<code>autodeploy-polling-interval-in-seconds</code>	<code>2</code>	(optional) Controls the polling frequency of autodeployment.
<code>autodeploy-dir</code>	<code>autodeploy</code>	(optional) Specifies the source directory (absolute or relative to <i>domain-dir</i> ) in which autodeployment looks for deployable components.
<code>autodeploy-verifier-enabled</code>	<code>false</code>	(optional) If <code>true</code> , the verifier is run before autodeployment. If verification fails, deployment is not performed.
<code>autodeploy-jsp-precompilation-enabled</code>	<code>false</code>	(optional) If <code>true</code> , JSP pages are precompiled during autodeployment.

TABLE 1-43    das-config Attributes        (Continued)

Attribute	Default	Description
deploy-xml-validation	full	(optional) Specifies the type of XML validation performed on standard and Application Server deployment descriptors: <ul style="list-style-type: none"><li>■ full - If XML validation fails, deployment fails.</li><li>■ parsing - XML validation errors are reported but deployment occurs.</li><li>■ none - No XML validation is performed.</li></ul>
admin-session-timeout-in-minutes	sun-web.xml timeoutSeconds property value or web.xml session-timeout attribute value	(optional) Specifies the Administration Console timeout.

## description

Contains a text description of the parent element.

## Superelements

[“admin-object-resource” on page 23](#), [“appclient-module” on page 26](#),  
[“connector-connection-pool” on page 41](#), [“connector-module” on page 45](#),

[“web-module” on page 152](#)

## Subelements

none - contains data

## diagnostic-service

Configures the Diagnostic Service, which lets you generate a diagnostic report for troubleshooting in case of Application Server malfunctioning such as exceptions, performance bottlenecks, or unexpected results.

## Superelements

[“config” on page 38](#)

## Subelements

The following table describes subelements for the `diagnostic-service` element.

TABLE 1–44 `diagnostic-service` Subelements

Element	Required	Description
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

## Attributes

The following table describes attributes for the `diagnostic-service` element.

TABLE 1–45 `diagnostic-service` Attributes

Attribute	Default	Description
<code>compute-checksum</code>	<code>true</code>	(optional) If <code>true</code> , computes a checksum of binaries.
<code>verify-config</code>	<code>true</code>	(optional) If <code>true</code> , captures the output of the <code>asadmin verify-domain-xml</code> command.
<code>capture-install-log</code>	<code>true</code>	(optional) If <code>true</code> , captures the log generated during Application Server installation.
<code>capture-system-info</code>	<code>true</code>	(optional) If <code>true</code> , collects operating system level information.
<code>capture-hadb-info</code>	<code>true</code>	(optional) If <code>true</code> , collects HADB related data. Applicable if HADB is installed and you have selected the enterprise profile. For more information about the HADB, see the <i>Sun Java System Application Server 9.1 High Availability Administration Guide</i> .
<code>capture-app-dd</code>	<code>true</code>	(optional) If <code>true</code> , captures application deployment descriptors in plain text. If any deployment descriptors contain confidential information, you should set it to <code>false</code> .
<code>min-log-level</code>	<code>INFO</code>	(optional) Specifies the log level for the diagnostic report. See <a href="#">“module-log-levels” on page 110</a> for a description of log levels. If set to <code>OFF</code> , log contents are not captured.
<code>max-log-entries</code>	<code>500</code>	(optional) Specifies the maximum number of log entries captured.

## domain

Defines a domain. This is the root element; there can only be one `domain` element in a `domain.xml` file.

## Superelements

none

## Subelements

The following table describes subelements for the domain element.

TABLE 1–46 domain Subelements

Element	Required	Description
<a href="#">“applications” on page 28</a>	zero or one	Contains deployed Java EE applications, Java EE modules, and lifecycle modules.
<a href="#">“resources” on page 125</a>	zero or one	Contains configured resources.
<a href="#">“configs” on page 40</a>	only one	Contains configurations.
<a href="#">“servers” on page 131</a>	only one	Contains server instances.
<a href="#">“clusters” on page 38</a>	zero or one	Contains clusters.
<a href="#">“node-agents” on page 115</a>	zero or one	Contains node agents.
<a href="#">“lb-configs” on page 97</a>	zero or one	Contains load balancing configurations.
<a href="#">“load-balancers” on page 101</a>	zero or one	Contains load balancers.
<a href="#">“system-property” on page 136</a>	zero or more	Specifies a system property.
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

## Attributes

The following table describes attributes for the domain element.

TABLE 1–47 domain Attributes

Attribute	Default	Description
application-root	<i>domain-dir/applications</i>	(optional) Specifies the absolute path where deployed applications reside for this domain.
log-root	<i>domain-dir/logs</i>	(optional) Specifies where the domain’s log files are kept. The directory in which the log is kept must be writable by whatever user account the server runs as. See the <a href="#">“log-service” on page 101</a> description for details about logs.
locale	operating system default	(optional) Specifies the domain’s language.

# E

## ejb-container

Configures the EJB container. Stateless session beans are maintained in pools. Stateful session beans have session affinity and are cached. Entity beans associated with a database primary key are also cached. Entity beans not yet associated with a primary key are maintained in pools. Pooled entity beans are used to run `ejbCreate()` and finder methods.

### Superelements

[“config” on page 38](#)

### Subelements

The following table describes subelements for the `ejb-container` element.

TABLE 1–48 `ejb-container` Subelements

Element	Required	Description
<a href="#">“ejb-timer-service” on page 57</a>	zero or one	Configures the EJB timer service.
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

### Attributes

The following table describes attributes for the `ejb-container` element.

TABLE 1–49 `ejb-container` Attributes

Attribute	Default	Description
<code>steady-pool-size</code>	32	(optional) Specifies the initial and minimum number of beans maintained in the pool. Must be 0 or greater and less than <code>max-pool-size</code> .  Bean instances are removed from the pool and returned after use. The pool is replenished or cleaned up periodically to maintain this size.  Applies to stateless session beans and entity beans.

TABLE 1-49 ejb-container Attributes (Continued)

Attribute	Default	Description
pool-resize-quantity	16	<p>(optional) Specifies the number of beans to be removed when the pool-idle-timeout-in-seconds timer expires. A cleaner thread removes any unused instances.</p> <p>Must be 0 or greater and less than max-pool-size . The pool is not resized below the steady-pool-size.</p> <p>Applies to stateless session beans and entity beans.</p>
max-pool-size	64	<p>(optional) Specifies the maximum number of beans that can be created to satisfy client requests. A value of 0 indicates an unbounded pool.</p> <p>Applies to stateless session beans and entity beans.</p>
cache-resize-quantity	32	<p>(optional) Specifies the number of beans to be:</p> <ul style="list-style-type: none"> <li>■ created if a request arrives when the pool has no available beans (subject to the max-cache-size limit)</li> <li>■ passivated when the cache-idle-timeout-in-seconds timer expires and a cleaner thread removes any unused instances, or when the cache size exceeds max-cache-size.</li> </ul> <p>Must be greater than 1 and less than max-cache-size.</p> <p>Applies to stateful session beans and entity beans.</p>
max-cache-size	512	<p>(optional) Specifies the maximum number of beans in the cache. A value of 0 indicates an unbounded cache.</p> <p>Applies to stateful session beans and entity beans.</p>
pool-idle-timeout-in-seconds	600	<p>(optional) Specifies the maximum time that a bean can remain idle in the pool. After this amount of time, the pool can remove this bean. A value of 0 specifies that idle beans can remain in the pool indefinitely.</p> <p>Applies to stateless session beans and entity beans.</p>
cache-idle-timeout-in-seconds	600	<p>(optional) Specifies the maximum time that a bean can remain idle in the cache. After this amount of time, the container can passivate this bean. A value of 0 specifies that beans never become candidates for passivation.</p> <p>Applies to stateful session beans and entity beans.</p>

TABLE 1-49 ejb-container Attributes (Continued)

Attribute	Default	Description
removal-timeout-in-seconds	5400	<p>(optional) Specifies the amount of time that a bean can remain passivated before it is removed from the session store. A value of 0 specifies that the container does not remove inactive beans automatically.</p> <p>If removal-timeout-in-seconds is less than or equal to cache-idle-timeout-in-seconds, beans are removed immediately without being passivated.</p> <p>The session-store attribute of the “server” on page 129 element determines the location of the session store.</p> <p>Applies to stateful session beans.</p>
victim-selection-policy	nru	<p>(optional) Specifies how stateful session beans are selected for passivation. Allowed values are fifo, lru, and nru:</p> <ul style="list-style-type: none"> <li>■ fifo - Selects the oldest instance.</li> <li>■ lru - Selects the least recently accessed instance.</li> <li>■ nru - Selects a not recently used instance.</li> </ul>
commit-option	B	(optional) Determines which commit option is used for entity beans. Legal values are B or C.
session-store	domain-dir/ session-store	(optional) Specifies the directory where passivated stateful session beans and persisted HTTP sessions are stored in the file system.

## ejb-container-availability

Enables availability in the EJB container, including stateful session bean (SFSB) state persistence. If HADB is installed and you have selected the enterprise profile, session state is persisted to the HADB. For additional replicated session persistence properties you can set, see “availability-service” on page 32.

### Superelements

“availability-service” on page 32

### Subelements

The following table describes subelements for the ejb-container-availability element.

TABLE 1-50 ejb-container-availability Subelements

Element	Required	Description
“property” on page 118	zero or more	Specifies a property or a variable.

## Attributes

The following table describes attributes for the `ejb-container-availability` element.

TABLE 1-51 `ejb-container-availability` Attributes

Attribute	Default	Description
<code>availability-enabled</code>	<code>true</code>	(optional) If set to <code>true</code> , and if availability is enabled for the server instance (see <a href="#">“availability-service” on page 32</a> ), high-availability features apply to all SFSBs deployed to the server instance that do not have availability disabled. All instances in a cluster should have the same availability value to ensure consistent behavior.
<code>sfsb-ha-persistence-type</code>	<code>ha</code>	(optional) Specifies the session persistence and passivation mechanism for SFSBs that have availability enabled. Allowed values are <code>file</code> (the file system) and <code>replicated</code> (other servers). If HADB is installed and you have selected the enterprise profile, you can also specify <code>ha</code> . For production environments that require session persistence, use <code>ha</code> .  If set to <code>file</code> , the <a href="#">“ejb-container” on page 53</a> element’s <code>session-store</code> attribute specifies the file system location where the passivated session bean state is stored. Checkpointing to the file system is useful for internal testing but is not supported for production environments.
<code>sfsb-persistence-type</code>	<code>file</code>	(optional) Specifies the passivation mechanism for SFSBs that <i>do not</i> have availability enabled. Allowed values are <code>file</code> and <code>replicated</code> . If HADB is installed and you have selected the enterprise profile, you can also specify <code>ha</code> .
<code>sfsb-store-pool-name</code>	<a href="#">“availability-service” on page 32</a> <code>store-pool-name</code> attribute value	(optional) Specifies the <code>jndi-name</code> of the <a href="#">“jdbc-resource” on page 88</a> used for connections to the HADB for session persistence. Applicable if HADB is installed and you have selected the enterprise profile.  For more information about setting up a connection pool and JDBC resource for the HADB, see the description of the <code>configure-ha-cluster</code> command in the <i>Sun Java System Application Server 9.1 Reference Manual</i> .

## ejb-module

Specifies a deployed EJB module.

## Superelements

[“applications” on page 28](#)

## Subelements

The following table describes subelements for the `ejb-module` element.

TABLE 1-52 `ejb-module` Subelements

Element	Required	Description
<a href="#">“description” on page 50</a>	zero or one	Contains a text description of this element.
<a href="#">“web-service-endpoint” on page 153</a>	zero or more	Configures a web service endpoint.
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

## Attributes

The following table describes attributes for the `ejb-module` element.

TABLE 1-53 `ejb-module` Attributes

Attribute	Default	Description
<code>name</code>	<code>none</code>	The name of the EJB module.
<code>location</code>	<code>none</code>	The location of the EJB module in the Application Server file system.
<code>object-type</code>	<code>user</code>	(optional) Defines the type of the resource. Allowed values are: <ul style="list-style-type: none"> <li>■ <code>system-all</code> - A system resource for all server instances and the domain application server.</li> <li>■ <code>system-admin</code> - A system resource only for the domain application server.</li> <li>■ <code>system-instance</code> - A system resource for all server instances only.</li> <li>■ <code>user</code> - A user resource.</li> </ul>
<code>enabled</code>	<code>true</code>	(optional) Determines whether the EJB module is enabled.
<code>libraries</code>	<code>none</code>	(optional) Specifies an absolute or relative path to libraries specific to this module or application. A relative path is relative to <i>domain-dir/lib/applibs</i> . If the path is absolute, the path must be accessible to the domain administration server (DAS), which means it must be under <i>domain-dir</i> . To include more than one path, use a system-specific separator, such as a colon for Solaris or a semicolon for Windows. The libraries are made available to the application in the order in which they are specified.
<code>availability-enabled</code>	<code>false</code>	(optional) Specifies whether availability is enabled in this EJB module for SFSB checkpointing (and potentially passivation). Availability must also be enabled for the application or stand-alone EJB module during deployment. For more information about availability, see <a href="#">“availability-service” on page 32</a> .
<code>directory-deployed</code>	<code>false</code>	(optional) Specifies whether the application has been deployed as a directory.

## ejb-timer-service

Configures the EJB timer service.

## Superelements

[“ejb-container” on page 53](#)

## Subelements

The following table describes subelements for the `ejb-timer-service` element.

TABLE 1-54 `ejb-timer-service` Subelements

Element	Required	Description
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

## Attributes

The following table describes attributes for the `ejb-timer-service` element.

TABLE 1-55 `ejb-timer-service` Attributes

Attribute	Default	Description
<code>minimum-delivery-interval-in-millis</code>	7000	(optional) Specifies the minimum time before an expiration for a particular timer can occur. This guards against extremely small timer increments that can overload the server.
<code>max-redeliveries</code>	1	(optional) Specifies the maximum number of times the EJB timer service attempts to redeliver a timer expiration due for exception or rollback.
<code>timer-datasource</code>	<code>jdbc/__TimerPool</code>	(optional) Overrides, for the cluster or server instance, the <code>cmp-resource</code> value specified in <code>sun-ejb-jar.xml</code> for the timer service system application ( <code>__ejb_container_timer_app</code> ).
<code>redelivery-interval-internal-in-millis</code>	5000	(optional) Specifies how long the EJB timer service waits after a failed <code>ejbTimeout</code> delivery before attempting a redelivery.

## event

Defines the event that triggers the action associated with a management rule.

Predefined events are provided with the Application Server. You can configure these events by changing event element attributes and properties.

You can create custom events by creating custom MBeans that implement the `JMX NotificationEmitter` interface. For more information about MBeans, see the *Sun Java System Application Server 9.1 Developer’s Guide* and <http://java.sun.com/j2se/1.5.0/docs/api/javax/management/package-summary.html>. For information about monitor MBeans, see <http://java.sun.com/j2se/1.5.0/docs/api/javax/management/monitor/package-summary.html>.

---

**Note** – If multiple rules are associated with the same event, ordering of action execution is not guaranteed.

---

## Superelements

[“management-rule” on page 105](#)

## Subelements

The following table describes subelements for the event element.

TABLE 1–56 event Subelements

Element	Required	Description
<a href="#">“description” on page 50</a>	zero or one	Contains a text description of this element.
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

## Attributes

The following table describes attributes for the event element.

TABLE 1-57 event Attributes

Attribute	Default	Description
type	none	<p>Specifies the type of event that triggers the management rule's action. Allowed values are as follows. The <code>cluster</code>, <code>lifecycle</code>, <code>log</code>, <code>monitor</code>, <code>timer</code>, and <code>trace</code> types are predefined events provided by the Application Server.</p> <p><b>Note</b> – Some topics in the documentation pertain to features that are available only in domains that are configured to support clusters. Examples of domains that support clusters are domains that are created with the cluster profile or the enterprise profile. For information about profiles, see “Usage Profiles” in <i>Sun Java System Application Server 9.1 Administration Guide</i>.</p> <ul style="list-style-type: none"><li>■ <code>cluster</code> — A Group Management Service (GMS) event. For more information, see “group-management-service” on page 66.</li><li>■ <code>lifecycle</code> — A lifecycle event. For more information about the server life cycle, see the <i>Sun Java System Application Server 9.1 Developer's Guide</i>.</li><li>■ <code>log</code> — An event in the server log. For more information about the server log, see “log-service” on page 101.</li><li>■ <code>monitor</code> — A monitoring event, which is a change in the attribute of a monitored “mbean” on page 107.</li><li>■ <code>notification</code> — A JMX notification event. Any custom “mbean” on page 107 that implements the JMX <code>NotificationEmitter</code> interface can be a notification event.</li><li>■ <code>timer</code> — An event that occurs at a specified time.</li><li>■ <code>trace</code> — A trace event.</li></ul> <p>For descriptions of required and optional properties corresponding to each of these types, see the following table.</p>
level	INFO	(optional) Specifies the level at which to log the event occurrence. For information about log levels, see “module-log-levels” on page 110. Applicable only if <code>record-event</code> is set to <code>true</code> .
record-event	true	<p>(optional) Specifies whether the occurrence of the event is logged. If no “action” on page 23 is specified for the parent “management-rule” on page 105, the event is logged regardless of this setting.</p> <p><b>Note</b> – Setting the type to <code>log</code> is different from setting <code>record-event</code> to <code>true</code>. The former specifies what the event is. The latter specifies what happens after the event occurs.</p>

## Properties

The following table describes properties for the event element. Property names are case insensitive.

TABLE 1-58 event Properties

Event Type	Property	Values	Description
cluster	name	start, stop, fail	Notifies when the GMS starts, stops, or reports failure of a server instance.

TABLE 1-58 event Properties (Continued)

Event Type	Property	Values	Description
cluster	serverName	A comma-separated list of server instance names, or * for all server instances	Specifies the server instances about which GMS notifications are given.
lifecycle	name	ready, shutdown, termination	Specifies a server life cycle event. Values correspond to events defined in the <code>com.sun.appserv.server.LifecycleEvent</code> interface.
log	loggerNames	A comma-separated list of logger names, or * for all loggers, which is the default	(optional) Notifies when the specified loggers write messages to the server log. For a list of logger names, see “ <a href="#">module-log-levels</a> ” on page 110.
log	level	A comma-separated list of log levels	(optional) Notifies when messages of the specified level are written to the server log. For information about log levels, see “ <a href="#">module-log-levels</a> ” on page 110.
monitor	observedMbean	A name attribute of a user-defined “ <a href="#">mbean</a> ” on page 107, or a JMX <code>ObjectName</code> for a system mbean	Specifies the name of the monitored MBean. Either this property or <code>observedObject</code> must be specified.
monitor	observedObject	An object - name attribute of a user-defined “ <a href="#">mbean</a> ” on page 107, or a JMX <code>ObjectName</code> for a system mbean	Specifies the name of the monitored MBean. Either this property or <code>observedMbean</code> must be specified.
monitor	observedAttribute	An “ <a href="#">mbean</a> ” on page 107 Attribute name	Specifies the monitored attribute of the monitored MBean.
monitor	monitorType	CounterMonitor, GaugeMonitor, StringMonitor	The type of monitoring of the attribute.
monitor	granularityPeriod	Time interval in seconds (long int)	(optional) Specifies the granularity at which the monitoring data should be collected.
monitor	notifyMatch	true or false	Specifies that the attribute value must match the <code>stringToCompare</code> value. Either this property or <code>notifyDiffer</code> is required if the monitor type is <code>StringMonitor</code> .
monitor	notifyDiffer	true or false	Specifies that the attribute value must not match the <code>stringToCompare</code> value. Either this property or <code>notifyMatch</code> is required if the monitor type is <code>StringMonitor</code> .
monitor	stringToCompare	A String	Specifies the value to which the attribute value is compared. Required if the monitor type is <code>StringMonitor</code> .

TABLE 1-58 event Properties (Continued)

Event Type	Property	Values	Description
monitor	numberType	byte, double, float, int, long, short	Specifies the type of the numeric value being monitored. Required if the monitor is of type CounterMonitor or GaugeMonitor.
monitor	differenceMode	true or false	Specifies the difference mode flag value common to all observed MBeans. Required if the monitor is of type CounterMonitor or GaugeMonitor.
monitor	initThreshold	A positive number of the type specified by numberType	Specifies a value above which notification occurs. Required if the monitor is of type CounterMonitor.
monitor	offset	A positive number of the type specified by numberType	(optional) Specifies that the event should be re-triggered when the initThreshold value plus this offset value is reached. Applicable if the monitor is of type CounterMonitor.
monitor	modulus	A positive number of the type specified by numberType	(optional) Specifies the modulus value common to all observed MBeans. Applicable if the monitor is of type CounterMonitor.
monitor	highThreshold	A positive number of the type specified by numberType	Specifies the upper limit of the range within which notification occurs. Required if the monitor is of type GaugeMonitor.
monitor	lowThreshold	A positive number of the type specified by numberType	Specifies the lower limit of the range within which notification occurs. Required if the monitor is of type GaugeMonitor.
notification	sourceMBean	name of “mbean” on page 107	Specifies a custom MBean that implements the JMX NotificationEmitter interface. Either this property or sourceObjectName must be specified.
notification	sourceObjectName	object-name of “mbean” on page 107	Specifies a custom MBean that implements the JMX NotificationEmitter interface. Either this property or sourceMBean must be specified.
notification	type	The notification type	(optional) Specifies the notification type. If this property is specified, the action of the parent “management-rule” on page 105 is performed only if the notification type emitted is same as this property's value.
timer	dateString	Input format determined by pattern property	Begins notification at the specified date and time.
timer	pattern	SimpleDateFormat pattern	(optional) Specifies the date and time input format. The default is mm/dd/yyyy hh:mm:ss.
timer	period	Time interval in milliseconds (long int)	(optional) Notification repeats at the specified time interval.

TABLE 1-58 event Properties (Continued)

Event Type	Property	Values	Description
timer	numberOfOccurrences	A positive number (long int)	(optional) Specifies the number of times notification occurs.
timer	message	A String	(optional) Specifies a message that is delivered as part of timer notification.
trace	name	web_component_method_entry, web_component_method_exit, ejb_component_method_entry, ejb_component_method_exit, request_start, request_end	Notifies at the specified trace point.
trace	ipAddress	An IP address	Specifies the IP address for which trace notifications are sent.
trace	callerPrincipal	A String	Specifies the caller principal for which trace notifications are sent.
trace	componentName	A String	Specifies the component name for which trace notifications are sent.

## extension-module

Specifies a deployed extension module.

### Superelements

[“applications” on page 28](#)

### Subelements

The following table describes subelements for the `extension-module` element.

TABLE 1-59 extension-module Subelements

Element	Required	Description
<a href="#">“description” on page 50</a>	zero or one	Contains a text description of this element.
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

### Attributes

The following table describes attributes for the `extension-module` element.

TABLE 1-60 extension-module Attributes

Attribute	Default	Description
name	none	The name of the extension module.
location	none	The location of the extension module in the Application Server file system.
module-type	none	Specifies a String that identifies the extension module type, which the runtime uses to find the appropriate add-on container. When an extension module is registered with the Application Server, the Application Server specifies the module type automatically.
object-type	user	(optional) Defines the type of the resource. Allowed values are: <ul style="list-style-type: none"><li>■ system-all - A system resource for all server instances and the domain application server.</li><li>■ system-admin - A system resource only for the domain application server.</li><li>■ system-instance - A system resource for all server instances only.</li><li>■ user - A user resource.</li></ul>
enabled	true	(optional) Determines whether the extension module is enabled.
libraries	none	(optional) Specifies an absolute or relative path to libraries specific to this module or application. A relative path is relative to <i>domain-dir/lib/applibs</i> . If the path is absolute, the path must be accessible to the domain administration server (DAS), which means it must be under <i>domain-dir</i> . To include more than one path, use a system-specific separator, such as a colon for Solaris or a semicolon for Windows. The libraries are made available to the application in the order in which they are specified.
availability-enabled	false	(optional) Specifies whether availability is enabled in this extension module. Availability must also be enabled for the application or stand-alone extension module during deployment. For more information about availability, see <a href="#">“availability-service” on page 32</a> .
directory-deployed	false	(optional) Specifies whether the application has been deployed as a directory.

## external-jndi-resource

Defines a resource that resides in an external JNDI repository. For example, a generic Java object could be stored in an LDAP server. An external JNDI factory must implement the `javax.naming.spi.InitialContextFactory` interface.

### Superelements

[“resources” on page 125](#)

### Subelements

The following table describes subelements for the `external-jndi-resource` element.

TABLE 1-61 external-jndi-resource Subelements

Element	Required	Description
<a href="#">“description” on page 50</a>	zero or one	Contains a text description of this element.
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

## Attributes

The following table describes attributes for the external-jndi-resource element.

TABLE 1-62 external-jndi-resource Attributes

Attribute	Default	Description
jndi-name	none	Specifies the JNDI name for the resource.
jndi-lookup-name	none	Specifies the JNDI lookup name for the resource.
res-type	none	Specifies the fully qualified type of the resource.
factory-class	none	Specifies the fully qualified name of the factory class, which implements <code>javax.naming.spi.InitialContextFactory</code> .  For more information about JNDI, see the <i>Sun Java System Application Server 9.1 Developer's Guide</i> .
object-type	user	(optional) Defines the type of the resource. Allowed values are: <ul style="list-style-type: none"> <li>■ <code>system-all</code> - A system resource for all server instances and the domain application server.</li> <li>■ <code>system-admin</code> - A system resource only for the domain application server.</li> <li>■ <code>system-instance</code> - A system resource for all server instances only.</li> <li>■ <code>user</code> - A user resource.</li> </ul>
enabled	true	(optional) Determines whether this resource is enabled at runtime.

## F

### filter-config

Configures the filter class that filters alerts from notification emitters. See also [“listener-config” on page 98](#).

### Superelements

[“alert-subscription” on page 26](#)

## Subelements

The following table describes subelements for the `filter-config` element.

TABLE 1-63 `filter-config` Subelements

Element	Required	Description
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

## Attributes

The following table describes attributes for the `filter-config` element.

TABLE 1-64 `filter-config` Attributes

Attribute	Default	Description
<code>filter-class-name</code>	none	Specifies the class name of the filter.

# G

## group-management-service

Configures the Group Management Service (GMS), an in-process service that provides cluster monitoring, cluster membership, and group communication services. The GMS performs the following functions:

- Notifies registered modules in an Application Server instance when one or more member instances are added to or removed from a cluster, or are suspected or confirmed to have failed.
- Provides the ability to send and receive messages between a group of processes.

The GMS is built atop a configurable stack of group membership discovery and health monitoring protocols. These protocols have properties that can be changed for a given network and deployment topology. Protocols in the GMS are as follows:

- Failure detection protocol -enables its members to periodically monitor other group members to determine their availability in the group.
- Discovery protocol -is used for discovery of the group and its members.
- Verify failure protocol -verifies suspect instances by adding a verification layer to mark a failure suspicion as a confirmed failure.

**Note** – Some topics in the documentation pertain to features that are available only in domains that are configured to support clusters. Examples of domains that support clusters are domains that are created with the cluster profile or the enterprise profile. For information about profiles, see “Usage Profiles” in *Sun Java System Application Server 9.1 Administration Guide*.

**Superelements**

[“config” on page 38](#)

**Subelements**

The following table describes subelements for the group-management-service element.

TABLE 1-65 group-management-service Subelements

Element	Required	Description
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

**Attributes**

The following table describes attributes for the group-management-service element.

TABLE 1-66 group-management-service Attributes

Attribute	Default	Description
failure-detection-max-tries	3	(optional) Specifies the maximum number of monitoring attempts before the GMS confirms that a failure is suspected in the group.
failure-detection-timeout-in-millis	2000	(optional) Specifies the time between monitoring attempts.
discovery-timeout-in-millis	2000	(optional) Specifies the time that the GMS waits for discovery of other members in the group.
verify-failure-timeout-in-millis	1500	(optional) Specifies the timeout after which a suspected failure is marked as verified.

H

**health-checker**

Defines a health checker for the parent [“server-ref” on page 130](#) or [“cluster-ref” on page 37](#) element.

### Superelements

[“cluster-ref” on page 37](#), [“server-ref” on page 130](#)

### Subelements

none

### Attributes

The following table describes attributes for the `health-checker` element.

TABLE 1-67 `health-checker` Attributes

Attribute	Default	Description
<code>url</code>	<code>/</code>	Specifies the URL to ping to determine the health state of a listener. This must be a relative URL.
<code>interval-in-seconds</code>	<code>30</code>	Specifies the interval between health checks. A value of zero means that health checking is disabled.
<code>timeout-in-seconds</code>	<code>10</code>	Specifies the maximum time in which a server must respond to a health check request to be considered healthy. If <code>interval-in-seconds</code> is greater than zero, <code>timeout-in-seconds</code> must be less than or equal to <code>interval-in-seconds</code> .

## http-access-log

Defines an access log file for a [“virtual-server” on page 143](#). The [“access-log” on page 22](#) subelement of the virtual server’s parent [“http-service” on page 75](#) element determines the access log file’s format and rotation settings.

### Superelements

[“virtual-server” on page 143](#)

### Subelements

none

### Attributes

The following table describes attributes for the `http-access-log` element.

TABLE 1-68 http-access-log Attributes

Attribute	Default	Description
log-directory	\${com.sun.aas.instanceRoot}/logs/access	(optional) Specifies the location of the access log file.
iponly	true	(optional) If true, specifies that only the IP address of the user agent is listed. If false, performs a DNS lookup.

## http-file-cache

Configures the HTTP file cache.

### Superelements

[“http-service” on page 75](#)

### Subelements

none

### Attributes

The following table describes attributes for the http-file-cache element.

TABLE 1-69 http-file-cache Attributes

Attribute	Default	Description
globally-enabled	false (developer profile) true (cluster and enterprise profiles)	(optional) If true, enables the file cache.
file-caching-enabled	false (developer profile) true (cluster and enterprise profiles)	(optional) If true, enables caching of the file content if the file size exceeds the small-file-size-limit-in-bytes.
max-age-in-seconds	30	(optional) Specifies the maximum age of a file cache entry.
medium-file-size-limit-in-bytes	537600	(optional) Specifies the maximum size of a file that can be cached as a memory mapped file.
medium-file-space-in-bytes	10485760	(optional) Specifies the total size of all files that are cached as memory mapped files.

TABLE 1-69 http-file-cache Attributes (Continued)

Attribute	Default	Description
small-file-size-limit-in-bytes	2048	(optional) Specifies the maximum size of a file that can be read into memory.
small-file-space-in-bytes	1048576	(optional) Specifies the total size of all files that are read into memory.
file-transmission-enabled	false	(optional) If true, enables the use of TransmitFileSystem calls. Meaningful only for Windows.
max-files-count	1024	(optional) Specifies the maximum number of files in the file cache.
hash-init-size	0	(optional) Specifies the initial number of hash buckets.

## http-listener

Defines an HTTP listen socket. The “[connection-pool](#)” on page 40 subelement of the parent “[http-service](#)” on page 75 element also configures some listen socket settings.

### Superelements

“[http-service](#)” on page 75

### Subelements

The following table describes subelements for the `http-listener` element.

TABLE 1-70 http-listener Subelements

Element	Required	Description
“ <a href="#">ssl</a> ” on page 134	zero or one	Defines Secure Socket Layer (SSL) parameters.
“ <a href="#">property</a> ” on page 118	zero or more	Specifies a property or a variable.

### Attributes

The following table describes attributes for the `http-listener` element.

TABLE 1-71 http-listener Attributes

Attribute	Default	Description
id	none	The unique listener name. An http-listener name cannot begin with a number.
address	none	IP address of the listener. Can be in dotted-pair or IPv6 notation. Can be any (for INADDR_ANY) to listen on all IP addresses. Can be a hostname.
port	none	Port number on which the listener listens. Legal values are 1 - 65535. On UNIX, creating sockets that listen on ports 1 - 1024 requires superuser privileges. Configuring an SSL listener to listen on port 443 is standard.
external-port	none	(optional) Specifies the external port on which the connection is made.
family		(optional) Deprecated. Do not use.
blocking-enabled	false	(optional) If true, uses a blocking socket for servicing a request.
acceptor-threads	1	(optional) Specifies the number of processors in the machine.  To set the number of request processing threads, use the thread-count attribute of the “request-processing” on page 123 element.
security-enabled	false	(optional) Determines whether the listener runs SSL. To turn SSL2 or SSL3 on or off and set ciphers, use an ssl subelement.
default-virtual-server	none	References the id attribute of the default “virtual-server” on page 143 for this particular listener.
server-name	none	Tells the server what to put in the host name section of any URLs it sends to the client. This affects URLs the server automatically generates; it doesn’t affect the URLs for directories and files stored in the server. If your server uses an alias, the server-name should be the alias name.  If a colon and port number are appended, that port is used in URLs the server sends to the client.  If load balancing is enabled, use the server name of the load balancer.
redirect-port	none	(optional) If the listener is supporting non-SSL requests and a request is received for which a matching <security-constraint> requires SSL transport, the request is automatically redirected to the port number specified here.  If load balancing is enabled, use the redirect port of the load balancer.
xpowered-by	true	(optional) If true, X-Powered-By headers are used according to the Servlet 2.4 and JSP 2.0 specifications.

TABLE 1-71 http-listener Attributes (Continued)

Attribute	Default	Description
enabled	true	<p>(optional) Determines whether the listener is active. If set to false, any attempts to connect to the listener result in a socket exception (<code>java.net.ConnectException</code>).</p> <p>In Application Server versions prior to 9.1, a listener whose <code>enabled</code> attribute was set to false returned a 404 response code for any requests sent to it. To achieve this behavior in the current Application Server version, set the listener's <code>enabled</code> attribute to <code>true</code>, and set every associated virtual server's state to <code>off</code>. A “<a href="#">virtual-server</a>” on page 143 lists its associated listeners in its <code>http-listeners</code> attribute.</p>

Properties

The following table describes properties for the `http-listener` element. Any of these properties can be defined as an “[http-service](#)” on page 75 property, so that it applies to all `http-listener` elements.

TABLE 1-72 http-listener Properties

Property	Default	Description
recycle-objects	true	If <code>true</code> , recycles internal objects instead of using the VM garbage collector.
reader-threads	0	Specifies the number of reader threads, which read bytes from the non-blocking socket.
acceptor-queue-length	4096	Specifies the length of the acceptor thread queue. Once full, connections are rejected.
reader-queue-length	4096	Specifies the length of the reader thread queue. Once full, connections are rejected.
use-nio-direct-bytebuffer	true	If <code>true</code> , specifies that the NIO direct <code>ByteBuffer</code> is used. In a limited resource environment, it might be faster to use non-direct Java's <code>ByteBuffer</code> by setting a value of <code>false</code> .
authPassthroughEnabled	false	If <code>true</code> , indicates that this <code>http-listener</code> element receives traffic from an SSL-terminating proxy server. Overrides the <code>authPassthroughEnabled</code> property of the parent “ <a href="#">http-service</a> ” on page 75 element.
proxyHandler	<code>com.sun.enterprise.web.ProxyHandlerImpl</code>	<p>Specifies the fully qualified class name of a custom implementation of the <code>com.sun.appserv.ProxyHandler</code> abstract class that this <code>http-listener</code> uses.</p> <p>Only used if the <code>authPassthroughEnabled</code> property of this <code>http-listener</code> and the parent “<a href="#">http-service</a>” on page 75 element are both set to <code>true</code>. Overrides the <code>proxyHandler</code> property of the parent <code>http-service</code> element.</p>

TABLE 1-72 http-listener Properties (Continued)

Property	Default	Description
proxiedProtocol	none	<p>Specifies a comma-separated list of protocols that can use the same port. Allowed values are ws/tcp (SOAP over TCP), http, https and tls.</p> <p>For example, if you set this property to http, https and set the port to 4567, you can access the port with either <code>http://host:4567/</code> or <code>https://host:4567/</code>.</p> <p>Specifying this property at the “http-service” on page 75 level overrides settings at the http-listener level. If this property is not set at either level, this feature is disabled.</p>
bufferSize	4096	Specifies the size, in bytes, of the buffer to be provided for input streams created by HTTP listeners.
connectionTimeout	30	Specifies the number of seconds HTTP listeners wait, after accepting a connection, for the request URI line to be presented.
maxKeepAliveRequests	250	Specifies the maximum number of HTTP requests that can be pipelined until the connection is closed by the server. Set this property to 1 to disable HTTP/1.0 keep-alive, as well as HTTP/1.1 keep-alive and pipelining.
traceEnabled	true	If true, enables the TRACE operation. Set this property to false to make the Application Server less susceptible to cross-site scripting attacks.
cometSupport	false	<p>If true, enables Comet support for this listener.</p> <p>If your servlet or JSP page uses Comet technology, make sure it is initialized when the Application Server starts up by adding the load-on-startup element to your web.xml file. For example:</p> <pre>&lt;servlet&gt;   &lt;servlet-name&gt;CheckIn&lt;/servlet-name&gt;   &lt;servlet-class&gt;CheckInServlet&lt;/servlet-class&gt;   &lt;load-on-startup&gt;0&lt;/load-on-startup&gt; &lt;/servlet&gt;</pre>
compression	off	<p>Specifies use of HTTP/1.1 GZIP compression to save server bandwidth. Allowed values are:</p> <ul style="list-style-type: none"> <li>■ off – Disables compression.</li> <li>■ on – Compresses data.</li> <li>■ force – Forces data compression in all cases.</li> <li>■ positive integer – Specifies the minimum amount of data required before the output is compressed.</li> </ul> <p>If the content-length is not known, the output is compressed only if compression is set to on or force.</p>
compressableMimeType	text/html, text/xml, text/plain	Specifies a comma-separated list of MIME types for which HTTP compression is used.

TABLE 1-72 http-listener Properties (Continued)

Property	Default	Description
noCompression UserAgents	empty String (regex matching disabled)	Specifies a comma-separated list of regular expressions matching user-agents of HTTP clients for which compression should not be used.
minCompressionSize	none	Specifies the minimum size of a file when compression is applied.
crlFile	none	Specifies the location of the Certificate Revocation List (CRL) file to consult during SSL client authentication. This can be an absolute or relative file path. If relative, it is resolved against <i>domain-dir</i> . If unspecified, CRL checking is disabled.
trustAlgorithm	none	Specifies the name of the trust management algorithm (for example, PKIX) to use for certification path validation.
trustMaxCertLength	5	Specifies the maximum number of non-self-issued intermediate certificates that can exist in a certification path. This property is considered only if trustAlgorithm is set to PKIX. A value of zero implies that the path can only contain a single certificate. A value of -1 implies that the path length is unconstrained (there is no maximum). Setting a value less than -1 causes an exception to be thrown.
disableUploadTimeout	true	if false, the connection for a servlet that reads bytes slowly is closed after the connectionUploadTimeout is reached.
connectionUpload Timeout	5	Specifies the timeout for uploads. Applicable only if disableUploadTimeout is set to false.
uriEncoding	UTF-8	Specifies the character set used to decode the request URIs received on this HTTP listener. Must be a valid IANA character set name. Overrides the uriEncoding property of the parent <a href="#">“http-service” on page 75</a> element.

## http-protocol

Configures HTTP protocol settings.

### Superelements

[“http-service” on page 75](#)

### Subelements

none

### Attributes

The following table describes attributes for the `http-protocol` element.

TABLE 1-73 http-protocol Attributes

Attribute	Default	Description
version	HTTP/1.1	(optional) Specifies the version of the HTTP protocol used.
dns-lookup-enabled	true	(optional) If true, looks up the DNS entry for the client.
forced-type	ISO-8859-1;en; ISO-8859-1	(optional) Specifies the request type used if no MIME mapping is available that matches the file extension. The format is a semicolon-delimited string consisting of the content-type, encoding, language, and charset.
default-type	text/html; ISO-8859-1;en; ISO-8859-1	(optional) Specifies the default response type. The format is a semicolon-delimited string consisting of the content-type, encoding, language, and charset.
forced-response-type	AttributeIs Deprecated	(optional) Deprecated. Do not use.
default-response-type	AttributeIs Deprecated	(optional) Deprecated. Do not use.
ssl-enabled	true	(optional) Not implemented. Use ssl subelements of <a href="#">“http-listener” on page 70</a> elements.

## http-service

Defines the HTTP service.

### Superelements

[“config” on page 38](#)

### Subelements

The following table describes subelements for the http-service element.

TABLE 1-74 http-service Subelements

Element	Required	Description
<a href="#">“access-log” on page 22</a>	zero or one	Defines access log settings for each <a href="#">“http-access-log” on page 68</a> subelement of each <a href="#">“virtual-server” on page 143</a> .
<a href="#">“http-listener” on page 70</a>	one or more	Defines an HTTP listen socket.
<a href="#">“virtual-server” on page 143</a>	one or more	Defines a virtual server.
<a href="#">“request-processing” on page 123</a>	zero or one	Configures request processing threads.

TABLE 1-74 http-service Subelements (Continued)

Element	Required	Description
“keep-alive” on page 95	zero or one	Configures keep-alive threads.
“connection-pool” on page 40	zero or one	Defines a pool of client HTTP connections.
“http-protocol” on page 74	zero or one	Configures HTTP protocol settings.
“property” on page 118	zero or more	Specifies a property or a variable.

Properties

The following table describes properties for the http-service element. These properties apply to all “[http-listener](#)” on page 70 subelements, except for `accessLoggingEnabled`, `accessLogBufferSize`, and `accessLogWriterInterval`, which apply to all “[virtual-server](#)” on page 143 subelements.

TABLE 1-75 http-service Properties

Property	Default	Description
monitoring-cache-enabled	true	If true, enables the monitoring cache.
monitoring-cache -refresh-in-millis	5000	Specifies the interval between refreshes of the monitoring cache.
ssl-cache-entries	10000	Specifies the number of SSL sessions to be cached.
ssl3-session-timeout	86400	Specifies the interval at which SSL3 sessions are cached.
ssl-session-timeout	100	Specifies the interval at which SSL2 sessions are cached.
recycle-objects	true	If true, recycles internal objects instead of using the VM garbage collector.
reader-threads	0	Specifies the number of reader threads, which read bytes from the non-blocking socket.
acceptor-queue-length	4096	Specifies the length of the acceptor thread queue. Once full, connections are rejected.
reader-queue-length	4096	Specifies the length of the reader thread queue. Once full, connections are rejected.
use-nio-direct- bytebuffer	true	If true, specifies that the NIO direct <code>ByteBuffer</code> is used. In a limited resource environment, it might be faster to use non-direct Java's <code>ByteBuffer</code> by setting a value of false.

TABLE 1-75 http-service Properties (Continued)

Property	Default	Description
authPassthroughEnabled	false	<p>If <code>true</code>, indicates that the “<a href="#">http-listener</a>” on page 70 subelements receive traffic from an SSL-terminating proxy server, which is responsible for forwarding any information about the original client request (such as client IP address, SSL key size, and authenticated client certificate chain) to the HTTP listeners using custom request headers.</p> <p>Each <code>http-listener</code> subelement can override this setting for itself.</p>
proxyHandler	<code>com.sun.enterprise.web.ProxyHandlerImpl</code>	<p>Specifies the fully qualified class name of a custom implementation of the <code>com.sun.appserv.ProxyHandler</code> abstract class, which allows a back-end application server instance to retrieve information about the original client request that was intercepted by an SSL-terminating proxy server (for example, a load balancer). An implementation of this abstract class inspects a given request for the custom request headers through which the proxy server communicates the information about the original client request to the Application Server instance, and returns that information to its caller.</p> <p>The default implementation reads the client IP address from an HTTP request header named <code>Proxy-ip</code>, the SSL key size from an HTTP request header named <code>Proxy-keysize</code>, and the SSL client certificate chain from an HTTP request header named <code>Proxy-auth-cert</code>. The <code>Proxy-auth-cert</code> value must contain the BASE-64 encoded client certificate chain without the BEGIN CERTIFICATE and END CERTIFICATE boundaries and with <code>\n</code> replaced with <code>% d% a</code>.</p> <p>Only used if <code>authPassthroughEnabled</code> is set to <code>true</code>. Each “<a href="#">http-listener</a>” on page 70 subelement can override the <code>proxyHandler</code> setting for itself.</p>
proxiedProtocol	none	<p>Specifies a comma-separated list of protocols that can use the same port. Allowed values are <code>ws/tcp</code> (SOAP over TCP), <code>http</code>, <code>https</code> and <code>tls</code>.</p> <p>For example, if you set this property to <code>http,https</code> and the port is 4567, you can access the port with either <code>http://host:4567/</code> or <code>https://host:4567/</code>.</p> <p>Specifying this property at the <code>http-service</code> level overrides settings at the “<a href="#">http-listener</a>” on page 70 level. If this property is not set at either level, this feature is disabled.</p>
bufferSize	4096	Specifies the size, in bytes, of the buffer to be provided for input streams created by HTTP listeners.
connectionTimeout	30	Specifies the number of seconds HTTP listeners wait, after accepting a connection, for the request URI line to be presented.
maxKeepAliveRequests	250	Specifies the maximum number of HTTP requests that can be pipelined until the connection is closed by the server. Set this property to 1 to disable HTTP/1.0 keep-alive, as well as HTTP/1.1 keep-alive and pipelining.

TABLE 1-75 http-service Properties (Continued)

Property	Default	Description
traceEnabled	true	If true, enables the TRACE operation. Set this property to false to make the Application Server less susceptible to cross-site scripting attacks.
accessLoggingEnabled	false (developer and cluster profiles) true (enterprise profile)	If true, enables access logging for all “virtual-server” on page 143 subelements that do not specify this property. If false, disables access logging for all virtual-server subelements that do not specify this property.
accessLogBufferSize	32768	Specifies the size, in bytes, of the buffer where access log calls are stored. If the value is less than 5120, a warning message is issued, and the value is set to 5120.
accessLogWriterInterval	300	Specifies the number of seconds before the log is written to the disk. The access log is written when the buffer is full or when the interval expires. If the value is 0, the buffer is always written even if it is not full. This means that each time the server is accessed, the log message is stored directly to the file.
sso-enabled	false (developer and cluster profiles) true (enterprise profile)	<p>If true, single sign-on is enabled by default for all web applications on all virtual servers on this server instance that are configured for the same realm. If false, single sign-on is disabled by default for all virtual servers, and users must authenticate separately to every application on each virtual server. The sso-enabled property setting of the “virtual-server” on page 143 element overrides this setting for an individual virtual server.</p> <p>At the http-service level, you cannot change the sso-max-inactive-seconds and sso-reap-interval-seconds values from their defaults. However, you can change these values at the virtual-server level.</p>
disableUploadTimeout	true	if false, the connection for a servlet that reads bytes slowly is closed after the connectionUploadTimeout is reached.
connectionUploadTimeout	5	Specifies the timeout for uploads. Applicable only if disableUploadTimeout is set to false.
uriEncoding	UTF-8	Specifies the character set used to decode the request URIs received on “http-listener” on page 70 subelements that do not define this property. Must be a valid IANA character set name.

## iiop-listener

Defines an IIOP listen socket. To enable SSL for this listener, include an ssl subelement.

## Superelements

[“iiop-service” on page 79](#)

## Subelements

The following table describes subelements for the `iiop-listener` element.

TABLE 1-76 `iiop-listener` Subelements

Element	Required	Description
<a href="#">“ssl” on page 134</a>	zero or one	Defines SSL parameters.
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

## Attributes

The following table describes attributes for the `iiop-listener` element.

TABLE 1-77 `iiop-listener` Attributes

Attribute	Default	Description
<code>id</code>	none	The listener name. An <code>iiop-listener</code> name cannot begin with a number.
<code>address</code>	none	IP address of the listener. Can be in dotted-pair or IPv6 notation, or just a name.
<code>port</code>	1072	(optional) Port number for the listener. Legal values are 1 - 65535. On UNIX, creating sockets that listen on ports 1 - 1024 requires superuser privileges.
<code>security-enabled</code>	false	(optional) Determines whether the listener runs SSL. To turn SSL2 or SSL3 on or off and set ciphers, use an <code>ssl</code> element.
<code>enabled</code>	true	(optional) Determines whether the listener is active.

## iiop-service

Defines the IIOP service.

## Superelements

[“config” on page 38](#)

## Subelements

The following table describes subelements for the `iiop-service` element.

TABLE 1-78 iiop-service Subelements

Element	Required	Description
<a href="#">“orb” on page 115</a>	only one	Configures the ORB.
<a href="#">“ssl-client-config” on page 135</a>	zero or one	Defines SSL parameters for the ORB.
<a href="#">“iiop-listener” on page 78</a>	zero or more	Defines an IIOP listen socket.

### Attributes

The following table describes attributes for the `iiop-service` element.

TABLE 1-79 iiop-service Attributes

Attribute	Default	Description
<code>client-authentication-required</code>	false	(optional) If <code>true</code> , the server rejects unauthenticated requests and inserts an authentication-required bit in IORs sent to clients.

## j2ee-application

Specifies a deployed Java EE application.

### Superelements

[“applications” on page 28](#)

### Subelements

The following table describes subelements for the `j2ee-application` element.

TABLE 1-80 j2ee-application Subelements

Element	Required	Description
<a href="#">“description” on page 50</a>	zero or one	Contains a text description of this element.
<a href="#">“web-service-endpoint” on page 153</a>	zero or more	Configures a web service endpoint.
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

### Attributes

The following table describes attributes for the `j2ee-application` element.

TABLE 1–81 j2ee-application Attributes

Attribute	Default	Description
name	none	The name of the application.
location	none	The location of the application in the Application Server file system.
object-type	user	(optional) Defines the type of the resource. Allowed values are: <ul style="list-style-type: none"> <li>■ system-all - A system resource for all server instances and the domain application server.</li> <li>■ system-admin - A system resource only for the domain application server.</li> <li>■ system-instance - A system resource for all server instances only.</li> <li>■ user - A user resource.</li> </ul>
enabled	true	(optional) Determines whether the application is enabled.
libraries	none	(optional) Specifies an absolute or relative path to libraries specific to this module or application. A relative path is relative to <i>domain-dir/lib/applibs</i> . If the path is absolute, the path must be accessible to the domain administration server (DAS), which means it must be under <i>domain-dir</i> . To include more than one path, use a system-specific separator, such as a colon for Solaris or a semicolon for Windows. The libraries are made available to the application in the order in which they are specified.
availability-enabled	false	(optional) Specifies whether availability is enabled in this Java EE application for HTTP session persistence and SFSB checkpointing (and potentially passivation). Availability must also be enabled for the application during deployment. For more information about availability, see <a href="#">“availability-service” on page 32</a> .
directory-deployed	false	(optional) Specifies whether the application has been deployed as a directory.
java-web-start-enabled	true	(optional) Specifies whether Java Web Start access is permitted for application clients in this application.

## jacc-provider

Specifies a Java Authorization Contract for Containers (JACC) provider for pluggable authorization.

### Superelements

[“security-service” on page 128](#)

### Subelements

The following table describes subelements for the `jacc-provider` element.

TABLE 1-82 jacc-provider Subelements

Element	Required	Description
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

### Attributes

The following table describes attributes for the jacc-provider element.

TABLE 1-83 jacc-provider Attributes

Attribute	Default	Description
name	default	Specifies the name of the JACC provider.
policy-provider	com.sun.enterprise.security.provider.PolicyWrapper	Corresponds to and can be overridden by the system property javax.security.jacc.policy.provider.
policy-configuration-factory-provider	com.sun.enterprise.security.provider.PolicyConfigurationFactoryImpl	Corresponds to and can be overridden by the system property javax.security.jacc.PolicyConfigurationFactory.provider.

## java-config

Specifies Java Virtual Machine (JVM) configuration parameters.

### Superelements

[“config” on page 38](#)

### Subelements

The following table describes subelements for the java-config element.

TABLE 1-84 java-config Subelements

Element	Required	Description
<a href="#">“profiler” on page 118</a>	zero or one	Configures a profiler for use with the Application Server.
<a href="#">“jvm-options” on page 95</a>	zero or more	Contains JVM command line options.
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

### Attributes

The following table describes attributes for the java-config element.

TABLE 1-85 java-config Attributes

Attribute	Default	Description
java-home	none	The path to the directory where the JDK is installed.
debug-enabled	false	(optional) If true, the server starts up in debug mode ready for attachment with a JPDA-based debugger.
debug-options	-Xdebug -Xrunjdwp: transport=dt_socket, server=y,suspend=n	(optional) Specifies JPDA (Java Platform Debugger Architecture) options. A list of debugging options is available at <a href="http://java.sun.com/products/jpda/doc/conninv.html#Invocation">http://java.sun.com/products/jpda/doc/conninv.html#Invocation</a> .  For more information about debugging, see the <i>Sun Java System Application Server 9.1 Developer's Guide</i> .
rmic-options	-iio -poa -alwaysgenerate -keepgenerated -g	(optional) Specifies options passed to the RMI compiler at application deployment time. The -keepgenerated option saves generated source for stubs and ties.  For details about the rmic command, see <a href="http://java.sun.com/j2se/1.5.0/docs/tooldocs/solaris/rmic.html">http://java.sun.com/j2se/1.5.0/docs/tooldocs/solaris/rmic.html</a> .
javac-options	-g	(optional) Specifies options passed to the Java compiler at application deployment time.
classpath-prefix	none	(optional) Specifies a prefix for the server classpath. Only prefix this classpath to override Application Server classes. Use this attribute with caution.
classpath-suffix	none	(optional) Specifies a suffix for the server classpath.
server-classpath	none	(optional) Specifies additions to the server classpath. Supported for backward compatibility. Use classpath-suffix instead.
system-classpath	JVM classes	(optional) Specifies additions to the system classpath, which is supplied to the JVM at server startup. These classes are loaded by the System Classloader.  <b>Note</b> – Do not remove the default path.
native-library-path-prefix	none	(optional) Specifies a prefix for the native library path.  The native library path is the automatically constructed concatenation of the Application Server installation relative path for its native shared libraries, the standard JRE native library path, the shell environment setting (LD_LIBRARY_PATH on UNIX), and any path specified in the profiler element. Since this is synthesized, it does not appear explicitly in the server configuration.
native-library-path-suffix	none	(optional) Specifies a suffix for the native library path.

TABLE 1-85 java-config Attributes (Continued)

Attribute	Default	Description
bytecode-preprocessors	none	(optional) A comma separated list of class names, each of which must implement the <code>com.sun.appserv.BytecodePreprocessor</code> interface. Each of the specified preprocessor classes is called in the order specified.
env-classpath-ignored	true	(optional) If <code>false</code> , the <code>CLASSPATH</code> environment variable is read and appended to the Application Server classpath. The <code>CLASSPATH</code> environment variable is added after the <code>classpath-suffix</code> , at the very end.  For a development environment, this value should be set to <code>false</code> . To prevent environment variable side effects in a production environment, set this value to <code>true</code> .

## jdbc-connection-pool

Defines the properties that are required for creating a JDBC connection pool.

### Superelements

[“resources” on page 125](#)

### Subelements

The following table describes subelements for the `jdbc-connection-pool` element.

TABLE 1-86 jdbc-connection-pool Subelements

Element	Required	Description
<a href="#">“description” on page 50</a>	zero or one	Contains a text description of this element.
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

### Attributes

The following table describes attributes for the `jdbc-connection-pool` element. Changing the following attributes requires a server restart: `datasource-classname`, `associate-with-thread`, `lazy-connection-association`, and `lazy-connection-enlistment`.

TABLE 1-87 jdbc-connection-pool Attributes

Attribute	Default	Description
name	none	Specifies the name of the connection pool. A “ <a href="#">jdbc-resource</a> ” on page 88 element’s pool-name attribute refers to this name.
datasource-classname	none	Specifies the class name of the associated vendor-supplied data source. This class must implement <code>javax.sql.DataSource</code> , <code>javax.sql.XADataSource</code> , <code>javax.sql.ConnectionPoolDataSource</code> , or a combination.
res-type	<code>javax.sql.DataSource</code>	(optional) Specifies the interface the data source class implements. The value of this attribute can be <code>javax.sql.DataSource</code> , <code>javax.sql.XADataSource</code> , or <code>javax.sql.ConnectionPoolDataSource</code> . If the value is not one of these interfaces, the default is used. An error occurs if this attribute has a legal value and the indicated interface is not implemented by the data source class.
steady-pool-size	8	(optional) Specifies the initial and minimum number of connections maintained in the pool.
max-pool-size	32	(optional) Specifies the maximum number of connections that can be created to satisfy client requests.
max-wait-time-in-millis	60000	(optional) Specifies the amount of time, in milliseconds, that the caller is willing to wait for a connection. If 0, the caller is blocked indefinitely until a resource is available or an error occurs.
pool-resize-quantity	2	(optional) Specifies the number of idle connections to be destroyed if the existing number of connections is above the steady-pool-size (subject to the max-pool-size limit).  This is enforced periodically at the idle-timeout-in-seconds interval. An idle connection is one that has not been used for a period of idle-timeout-in-seconds. When the pool size reaches steady-pool-size, connection removal stops.
idle-timeout-in-seconds	300	(optional) Specifies the maximum time that a connection can remain idle in the pool. After this amount of time, the pool can close this connection.
transaction-isolation-level	default JDBC driver isolation level	(optional) Specifies the transaction isolation level on the pooled database connections. Allowed values are <code>read-uncommitted</code> , <code>read-committed</code> , <code>repeatable-read</code> , or <code>serializable</code> .  Applications that change the isolation level on a pooled connection programmatically risk polluting the pool, which can lead to errors. See <code>is-isolation-level-guaranteed</code> for more details.
is-isolation-level-guaranteed	true	(optional) Applicable only when <code>transaction-isolation-level</code> is explicitly set. If true, every connection obtained from the pool is guaranteed to have the desired isolation level. This might impact performance on some JDBC drivers. Only set this attribute to false if you are certain that the hosted applications do not return connections with altered isolation levels.

TABLE 1-87 jdbc-connection-pool Attributes (Continued)

Attribute	Default	Description
is-connection-validation-required	false	(optional) Specifies whether connections have to be validated before being given to the application. If a resource's validation fails, it is destroyed, and a new resource is created and returned.
connection-validation-method	auto-commit	(optional) Legal values are as follows: <ul style="list-style-type: none"> <li>■ auto-commit (default), which uses <code>Connection.setAutoCommit()</code> (<code>Connection.getAutoCommit()</code>)</li> <li>■ meta-data, which uses <code>Connection.getMetaData()</code></li> <li>■ table, which performs a query on a table specified in the <code>validation-table-name</code> attribute</li> </ul>
validation-table-name	none	(optional) Specifies the table name to be used to perform a query to validate a connection. This parameter is mandatory if and only if <code>connection-validation-method</code> is set to <code>table</code> .
fail-all-connections	false	(optional) If <code>true</code> , closes all connections in the pool if a single validation check fails. This parameter is mandatory if and only if <code>is-connection-validation-required</code> is set to <code>true</code> .
non-transactional-connections	false	(optional) If <code>true</code> , non-transactional connections can be made to the JDBC connection pool. These connections are not automatically enlisted with the transaction manager.
allow-non-component-callers	false	(optional) If <code>true</code> , non-Java-EE components, such as servlet filters, lifecycle modules, and third party persistence managers, can use this JDBC connection pool. The returned connection is automatically enlisted with the transaction context obtained from the transaction manager. Standard Java EE components can also use such pools. Connections obtained by non-component callers are not automatically closed at the end of a transaction by the container. They must be explicitly closed by the caller.
connection-leak-timeout-in-seconds	0	Detects potential connection leaks by the application. A connection that is not returned back to the pool by the application within the specified period is assumed to be potentially leaking, and a stack trace of the caller is logged. A zero value disables leak detection. A nonzero value enables leak tracing.
connection-leak-reclaim	false	If <code>true</code> , the pool will reclaim a connection after <code>connection-leak-timeout-in-seconds</code> occurs.
connection-creation-retry-attempts	0	Specifies the number of attempts to create a new connection.
connection-creation-retry-interval-in-seconds	10	Specifies the time interval between attempts to create a connection when <code>connection-creation-retry-attempts</code> is greater than 0.
validate-atmost-once-period-in-seconds	0	Specifies the time interval within which a connection is validated at most once. Minimizes the number of validation calls.

TABLE 1-87 jdbc-connection-pool Attributes (Continued)

Attribute	Default	Description
statement-timeout-in-seconds	-1	Sets the query timeout property of a statement to enable termination of abnormally long running queries. The default value of -1 disables this feature.
lazy-connection-enlistment	false	If true, a connection is not enlisted in a transaction until it is used. If false, any connection object available to a transaction is enlisted in the transaction.
lazy-connection-association	false	If true, a physical connection is not associated with a logical connection until it is used. If false, a physical connection is associated with a logical connection even before it is used.
associate-with-thread	false	If true, allows a connection to be saved as a <code>ThreadLocal</code> in the calling thread. This connection gets reclaimed only when the calling thread dies or when the calling thread is not in use and the pool has run out of connections.
match-connections	false	If true, enables connection matching. You can set to false if connections are homogeneous.
max-connection-usage-count	0	Specifies the number of times a connections is reused by the pool, after which it is closed. A zero value disables this feature.
wrap-jdbc-objects	false	If true, the application returns wrapped JDBC objects for <code>Statement</code> , <code>PreparedStatement</code> , <code>CallableStatement</code> , <code>ResultSet</code> , and <code>DatabaseMetaData</code> .

## Properties

Most JDBC drivers allow use of standard property lists to specify the user, password, and other resource configuration information. Although properties are optional with respect to the Application Server, some properties might be necessary for most databases. For details, see the JDBC 4.0 Standard Extension API.

When properties are specified, they are passed to the vendor's data source class (specified by the `datasource-classname` attribute) as is using `setName(value)` methods.

The user and password properties are used as the default principal if container managed authentication is specified and a `default-resource-principal` is not found in the application deployment descriptors.

The following table describes some common properties for the `jdbc-connection-pool` element.

Changing JDBC driver properties requires a server restart.

TABLE 1-88 jdbc-connection-pool Properties

Property	Description
user	Specifies the user name for connecting to the database.

TABLE 1-88 jdbc-connection-pool Properties (Continued)

Property	Description
password	Specifies the password for connecting to the database.
databaseName	Specifies the database for this connection pool.
serverName	Specifies the database server for this connection pool.
port	Specifies the port on which the database server listens for requests.
networkProtocol	Specifies the communication protocol.
roleName	Specifies the initial SQL role name.
datasourceName	Specifies an underlying <code>XADataSource</code> , or a <code>ConnectionPoolDataSource</code> if connection pooling is done.
description	Specifies a text description.
url	Specifies the URL for this connection pool. Although this is not a standard property, it is commonly used.
LazyConnection Enlistment	Deprecated. Use the equivalent attribute.
LazyConnection Association	Deprecated. Use the equivalent attribute.
AssociateWithThread	Deprecated. Use the equivalent attribute.
MatchConnections	Deprecated. Use the equivalent attribute.

## jdbc-resource

Defines a JDBC (`javax.sql.DataSource`) resource.

### Superelements

[“resources” on page 125](#)

### Subelements

The following table describes subelements for the `jdbc-resource` element.

TABLE 1-89 jdbc-resource Subelements

Element	Required	Description
<a href="#">“description” on page 50</a>	zero or one	Contains a text description of this element.
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

## Attributes

The following table describes attributes for the `jdbc-resource` element.

TABLE 1-90 `jdbc-resource` Attributes

Attribute	Default	Description
<code>jndi-name</code>	<code>none</code>	Specifies the JNDI name for the resource.
<code>pool-name</code>	<code>none</code>	Specifies the name of the associated <a href="#">“jdbc-connection-pool”</a> on page 84.
<code>object-type</code>	<code>user</code>	(optional) Defines the type of the resource. Allowed values are: <ul style="list-style-type: none"> <li>▪ <code>system-all</code> - A system resource for all server instances and the domain application server.</li> <li>▪ <code>system-admin</code> - A system resource only for the domain application server.</li> <li>▪ <code>system-instance</code> - A system resource for all server instances only.</li> <li>▪ <code>user</code> - A user resource.</li> </ul>
<code>enabled</code>	<code>true</code>	(optional) Determines whether this resource is enabled at runtime.

## jms-availability

Enables availability in the Sun Java System Message Queue cluster that comprises the Java Message Service (JMS). Messages are saved to the HADB. The HADB must be installed and the enterprise profile must be selected. You must enable availability for Application Server instances before you can enable availability for the corresponding Message Queue brokers.

---

**Note** – Individual applications and modules cannot control or override JMS availability.

---

---

**Note** – Some topics in the documentation pertain to features that are available only in domains that are configured to support clusters. Examples of domains that support clusters are domains that are created with the cluster profile or the enterprise profile. For information about profiles, see “Usage Profiles” in *Sun Java System Application Server 9.1 Administration Guide*.

---

## Superelements

[“availability-service”](#) on page 32

## Subelements

The following table describes subelements for the `jms-availability` element.

TABLE 1-91    `.jms-availability` Subelements

Element	Required	Description
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

### Attributes

The following table describes attributes for the `.jms-availability` element.

TABLE 1-92    `.jms-availability` Attributes

Attribute	Default	Description
<code>availability-enabled</code>	<code>false</code>	(optional) If set to <code>true</code> , and if availability is enabled for the Application Server instance (see <a href="#">“availability-service” on page 32</a> ), high-availability is enabled for the Message Queue cluster associated with the Application Server cluster. All instances in an Application Server cluster should have the same availability settings to ensure consistent behavior.
<code>mq-store-pool-name</code>	<a href="#">“availability-service” on page 32</a> <code>store-pool-name</code> attribute value	(optional) Specifies the <code>jndi-name</code> of the <a href="#">“jdbc-resource” on page 88</a> used for connections to the HADB for the Message Queue cluster. Applicable if HADB is installed and you have selected the enterprise profile.  For more information about setting up a connection pool and JDBC resource for the HADB, see the description of the <code>configure-ha-cluster</code> command in the <i>Sun Java System Application Server 9.1 Reference Manual</i> .

## `.jms-host`

Configures the host of the built-in Java Message Service (JMS) that is managed by the Application Server.

### Superelements

[“jms-service” on page 91](#)

### Subelements

The following table describes subelements for the `.jms-host` element.

TABLE 1-93    `.jms-host` Subelements

Element	Required	Description
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

### Attributes

The following table describes attributes for the `.jms-host` element.

TABLE 1-94 `jms-host` Attributes

Attribute	Default	Description
<code>name</code>	<code>none</code>	Specifies the name of the JMS host.
<code>host</code>	<i>machine-name</i>	(optional) Specifies the host name of the JMS host.
<code>port</code>	<code>7676</code>	(optional) Specifies the port number used by the JMS provider.
<code>admin-user-name</code>	<code>admin</code>	(optional) Specifies the administrator user name for the JMS provider.
<code>admin-password</code>	<code>admin</code>	(optional) Specifies the administrator password for the JMS provider.

## jms-service

Configures the built-in Java Message Service (JMS) that is managed by the Application Server.

### Superelements

[“config” on page 38](#)

### Subelements

The following table describes subelements for the `jms-service` element.

TABLE 1-95 `jms-service` Subelements

Element	Required	Description
<a href="#">“jms-host” on page 90</a>	zero or more	Specifies a host.
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

### Attributes

The following table describes attributes for the `jms-service` element.

TABLE 1-96 `jms-service` Attributes

Attribute	Default	Description
<code>init-timeout-in-seconds</code>	<code>60</code>	(optional) Specifies the amount of time the server instance waits at startup for its configured default JMS host to respond. If there is no response, startup is aborted. If set to <code>0</code> , the server instance waits indefinitely.

TABLE 1-96 `jms-service` Attributes (Continued)

Attribute	Default	Description
<code>type</code>	EMBEDDED (DAS) or LOCAL (other server instances)	<p>Specifies the type of JMS service:</p> <ul style="list-style-type: none"> <li>■ EMBEDDED means the JMS provider is started in the same JVM as the Application Server, and the networking stack is bypassed. Lazy initialization starts the default embedded broker on the first access of JMS services rather than at Application Server startup. EMBEDDED mode is not a supported configuration for a cluster.</li> <li>■ LOCAL means the JMS provider is started along with the Application Server. The LOCAL setting implicitly sets up a 1:1 relationship between an Application Server instance and a Message Queue broker. When you create an Application Server cluster, a Message Queue cluster is automatically created as well. During cluster creation, each instance in the Application Server cluster is automatically configured with a broker in the Message Queue cluster, and a unique broker port is determined.</li> <li>■ REMOTE means the JMS provider is remote and is not started by the Application Server.</li> </ul>
<code>start-args</code>	none	(optional) Specifies the string of arguments supplied for startup of the corresponding JMS instance.
<code>default-jms-host</code>	none	Specifies the name of the default “ <code>jms-host</code> ” on page 90. If <code>type</code> is set to LOCAL, this <code>jms-host</code> is automatically started at Application Server startup.
<code>reconnect-interval-in-seconds</code>	5 (developer profile) 60 (cluster and enterprise profiles)	(optional) Specifies the interval between reconnect attempts.
<code>reconnect-attempts</code>	3	(optional) Specifies the number of reconnect attempts.
<code>reconnect-enabled</code>	true	<p>(optional) If <code>true</code>, reconnection is enabled. The JMS service automatically tries to reconnect to the JMS provider when the connection is broken.</p> <p>When the connection is broken, depending on the message processing stage, the <code>onMessage()</code> method might not be able to complete successfully or the transaction might be rolled back due to a JMS exception. When the JMS service reestablishes the connection, JMS message redelivery semantics apply.</p>
<code>addresslist-behavior</code>	random	(optional) Specifies whether the reconnection logic selects the broker from the <code>imqAddressList</code> in a random or sequential (priority) fashion.
<code>addresslist-iterations</code>	3	(optional) Specifies the number of times the reconnection logic iterates over the <code>imqAddressList</code> if <code>addresslist-behavior</code> is set to PRIORITY.
<code>mq-scheme</code>	mq	(optional) Specifies the scheme for establishing connection with the broker. For example, specify <code>http</code> for connecting to the broker over HTTP.

TABLE 1-96 `jms-service` Attributes (Continued)

Attribute	Default	Description
<code>mq-service</code>	<code>jms</code>	(optional) Specifies the type of broker service. If a broker supports SSL, the type of service can be <code>ssljms</code> .

## Properties

The following table describes properties for the `jms-service` element.

TABLE 1-97 `jms-service` Properties

Property	Default	Description
<code>instance-name</code>	<code>imqbroker</code>	Specifies the full Sun Java System Message Queue broker instance name.
<code>instance-name-suffix</code>	<code>none</code>	Specifies a suffix to add to the full Message Queue broker instance name. The suffix is separated from the instance name by an underscore character ( <code>_</code> ). For example, if the instance name is <code>imqbroker</code> , appending the suffix <code>xyz</code> changes the instance name to <code>imqbroker_xyz</code> .
<code>append-version</code>	<code>false</code>	If <code>true</code> , appends the major and minor version numbers, preceded by underscore characters ( <code>_</code> ), to the full Message Queue broker instance name. For example, if the instance name is <code>imqbroker</code> , appending the version numbers changes the instance name to <code>imqbroker_8_0</code> .
<code>user-name</code>	<code>guest</code>	Specifies the user name for creating the JMS connection. Needed only if the default username/password of <code>guest/guest</code> is not available in the broker.
<code>password</code>	<code>guest</code>	Specifies the password for creating the JMS connection. Needed only if the default username/password of <code>guest/guest</code> is not available in the broker.

## jmx-connector

Configures a JSR 160/255 compliant remote JMX connector, which handles the JMX communication between the domain administration server, the node agents, and the remote server instances. This JMX connector also handles JMX communication between an external management client and the domain administration server.

Only the system JMX connector is started by the server processes at startup. Do not configure additional JMX connectors.

## Superelements

[“admin-service” on page 24](#), [“node-agent” on page 114](#)

## Subelements

The following table describes subelements for the `jmx-connector` element.

TABLE 1–98 jmx-connector Subelements

Element	Required	Description
<a href="#">“ssl” on page 134</a>	zero or one	Defines SSL parameters.
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

## Attributes

The following table describes attributes for the `jmx-connector` element.

TABLE 1–99 jmx-connector Attributes

Attribute	Default	Description
<code>name</code>	<code>none</code>	Specifies the name of the connector used by the designated system JMX connector for JMX communication between server instances. Do not modify this name.
<code>protocol</code>	<code>rmi_jrmp</code>	(optional) Specifies the protocol that this JMX connector supports. The only supported protocol is <code>rmi_jrmp</code> . Do not modify this value.
<code>address</code>	<code>0.0.0.0</code>	Specifies the IP address of the naming service where the JMX connector server stub is registered. This is not the port of the server socket that does the actual JMX communication. This is the address of the network interface where the RMI registry is started. If your system has multiple network interfaces, modify this value so that only a particular interface is selected.
<code>port</code>	8686 (DAS, all profiles; server instance, developer profile) 38686 (server instances, cluster and enterprise profiles)	Specifies the port number on which the naming service (RMI registry) listens for RMI client connections. The only use of this naming service is to download the RMI stubs. If the default port is occupied, a free port is used. Legal values are 1 - 65535. On UNIX, creating sockets that listen on ports 1 - 1024 requires superuser privileges.
<code>auth-realm-name</code>	<code>admin-realm</code>	Specifies the name of an <a href="#">“auth-realm” on page 29</a> subelement of the <a href="#">“security-service” on page 128</a> element for the server instance that is running this JMX connector's server end. Note that this is a dedicated administration security realm.
<code>security-enabled</code>	false (developer profile) true (cluster and enterprise profiles)	(optional) Determines whether JMX communication is encrypted.

## jvm-options

Contains JVM command line options, for example:

```
<jvm-options>-Xdebug -Xmx128m</jvm-options>
```

For information about JVM options, see

<http://java.sun.com/docs/hotspot/VMOptions.html>.

### Superelements

“java-config” on page 82, “profiler” on page 118

### Subelements

none - contains data

## K

## keep-alive

Configures keep-alive threads.

### Superelements

“http-service” on page 75

### Subelements

none

### Attributes

The following table describes attributes for the keep-alive element.

TABLE 1-100 keep-alive Attributes

Attribute	Default	Description
thread-count	1	(optional) Specifies the number of keep-alive threads.
max-connections	256	(optional) Specifies the maximum number of keep-alive connections.

TABLE 1-100 keep-alive Attributes (Continued)

Attribute	Default	Description
timeout-in-seconds	60	(optional) Specifies the maximum time for which a keep alive connection is kept open.

L

## lb-config

Defines a load balancer configuration, which can be referenced by a physical “load-balancer” on [page 99](#).

**Note** – Some topics in the documentation pertain to features that are available only in domains that are configured to support clusters. Examples of domains that support clusters are domains that are created with the cluster profile or the enterprise profile. For information about profiles, see “Usage Profiles” in *Sun Java System Application Server 9.1 Administration Guide*.

## Superelements

“lb-configs” on [page 97](#)

## Subelements

The following table describes subelements for the lb-config element.

TABLE 1-101 lb-config Subelements

Element	Required	Description
“cluster-ref” on <a href="#">page 37</a>	zero or more; zero if a server-ref is defined	References a cluster. This element contains some attributes related to load balancing.
“server-ref” on <a href="#">page 130</a>	zero or more; zero if a cluster-ref is defined	References a server instance that does not belong to a cluster. The referenced “server” on <a href="#">page 129</a> element contains some attributes related to load balancing.
“property” on <a href="#">page 118</a>	zero or more	Specifies a property or a variable.

## Attributes

The following table describes attributes for the lb-config element.

TABLE 1-102 lb-config Attributes

Attribute	Default	Description
name	none	Specifies the name of the load balancer configuration.
response-timeout-in-seconds	60	(optional) Specifies the time within which a server must return a response or it is considered unhealthy.
https-routing	false	(optional) If true, HTTPS requests to the load balancer result in HTTPS requests to the server. If false, HTTPS requests to the load balancer result in HTTP requests to the server.
reload-poll-interval-in-seconds	60	(optional) Specifies the interval between checks for changes to the load balancer configuration file (loadbalancer.xml). When changes are detected, the file is reloaded. A value of zero disables reloading.
monitoring-enabled	false	(optional) If true, enables monitoring of load balancing.

## lb-configs

Contains load balancer configurations.

### Superelements

[“domain” on page 51](#)

### Subelements

The following table describes subelements for the lb-configs element.

TABLE 1-103 lb-configs Subelements

Element	Required	Description
<a href="#">“lb-config” on page 96</a>	zero or more	Defines a load balancer configuration.

## lifecycle-module

Specifies a deployed lifecycle module. For more information about lifecycle modules, see the *Sun Java System Application Server 9.1 Developer's Guide*.

### Superelements

[“applications” on page 28](#)

### Subelements

The following table describes subelements for the lifecycle-module element.

TABLE 1-104 lifecycle-module Subelements

Element	Required	Description
<a href="#">“description” on page 50</a>	zero or one	Contains a text description of this element.
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

## Attributes

The following table describes attributes for the `lifecycle-module` element.

TABLE 1-105 lifecycle-module Attributes

Attribute	Default	Description
<code>name</code>	none	The name of the lifecycle module.
<code>class-name</code>	none	The fully qualified name of the lifecycle module’s class file, which must implement the <code>com.sun.appserv.server.LifecycleListener</code> interface.
<code>classpath</code>	value of <code>application-root</code> attribute of <a href="#">“domain” on page 51</a> element	(optional) The classpath for the lifecycle module. Specifies where the module is located.
<code>load-order</code>	none	(optional) Determines the order in which lifecycle modules are loaded at startup. Modules with smaller integer values are loaded sooner. Values can range from 101 to the operating system’s MAXINT. Values from 1 to 100 are reserved.
<code>is-failure-fatal</code>	false	(optional) Determines whether the server is shut down if the lifecycle module fails.
<code>object-type</code>	user	(optional) Defines the type of the resource. Allowed values are: <ul style="list-style-type: none"><li>■ <code>system-all</code> - A system resource for all server instances and the domain application server.</li><li>■ <code>system-admin</code> - A system resource only for the domain application server.</li><li>■ <code>system-instance</code> - A system resource for all server instances only.</li><li>■ <code>user</code> - A user resource.</li></ul>
<code>enabled</code>	true	(optional) Determines whether the lifecycle module is enabled.

## listener-config

Configures the listener class that listens for alerts from notification emitters. For example:

```
<listener-config
  listener-class-name="com.sun.enterprise.admin.notification.MailAlert"
  subscribe-listener-with="LogMBean,ServerStatusMonitor" >
```

```

<property name="recipients" value="Huey@sun.com,Dewey@sun.com" />
<property name="fromAddress" value="Louie@sun.com" />
<property name="subject" value="Help!" />
<property name="includeDiagnostics" value="false" />
<property name="mailSMTPHost" value="ducks.sun.com" />
</listener-config>

```

## Superelements

[“alert-subscription” on page 26](#)

## Subelements

The following table describes subelements for the `listener-config` element.

TABLE 1-106 listener-config Subelements

Element	Required	Description
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

## Attributes

The following table describes attributes for the `listener-config` element.

TABLE 1-107 listener-config Attributes

Attribute	Default	Description
<code>listener-class-name</code>	none	Specifies the class name of the listener. The <code>com.sun.appserv.admin.notification.MailAlert</code> class is provided with the Application Server, but a custom listener can be used.
<code>subscribe-listener-with</code>	none	Specifies a comma-separated list of notification emitters to which the listener listens. The <code>LogMBean</code> and <code>ServerStatusMonitor</code> notification emitters are provided with the Application Server, but custom emitters can be used.

## load-balancer

Defines and configures a load balancer. For more information about load balancing in the Application Server, see the *Sun Java System Application Server 9.1 High Availability Administration Guide*.

**Note** – Some topics in the documentation pertain to features that are available only in domains that are configured to support clusters. Examples of domains that support clusters are domains that are created with the cluster profile or the enterprise profile. For information about profiles, see “Usage Profiles” in *Sun Java System Application Server 9.1 Administration Guide*.

## Superelements

[“load-balancers” on page 101](#)

## Subelements

The following table describes subelements for the load-balancer element.

TABLE 1-108 load-balancer Subelements

Element	Required	Description
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

## Attributes

The following table describes attributes for the load-balancer element.

TABLE 1-109 load-balancer Attributes

Attribute	Default	Description
name	none	Specifies the name of the load balancer.
lb-config-name	none	Specifies the name of the <a href="#">“lb-config” on page 96</a> used by the load balancer.
auto-apply-enabled	false	(optional) If true, changes to the specified <a href="#">“lb-config” on page 96</a> are automatically applied to the load balancer.

## Properties

The following table describes properties for the load-balancer element.

TABLE 1-110 load-balancer Properties

Property	Default	Description
device-host	none	Specifies the host name or IP address for the load balancer.
device-admin-port	none	Specifies the load balancer's device administration port number.
ssl-proxy-host	none	Specifies the load balancer's proxy host used for outbound HTTP.

TABLE 1-110 load-balancer Properties (Continued)

Property	Default	Description
ssl-proxy-port	none	Specifies the load balancer's proxy port used for outbound HTTP.

## load-balancers

Contains load balancers.

### Superelements

[“domain” on page 51](#)

### Subelements

The following table describes subelements for the load-balancers element.

TABLE 1-111 load-balancers Subelements

Element	Required	Description
<a href="#">“load-balancer” on page 99</a>	zero or more	Defines a load balancer.

## log-service

Configures the *server log* file, which stores messages from the default virtual server. Messages from other configured virtual servers also go here, unless the `log-file` attribute is explicitly specified in the `virtual-server` element. The default name is `server.log`.

Other log files are configured by other elements:

- A *virtual server log* file stores messages from a `virtual-server` element that has an explicitly specified `log-file` attribute. See [“virtual-server” on page 143](#).
- The *access log* file stores HTTP access messages from the default virtual server. The default name is `access.log`. See [“access-log” on page 22](#) and [“http-access-log” on page 68](#).
- The *transaction log* files store transaction messages from the default virtual server. The default name of the directory for these files is `tx`. See [“transaction-service” on page 139](#).

### Superelements

[“config” on page 38](#), [“node-agent” on page 114](#)

### Subelements

The following table describes subelements for the log-service element.

TABLE 1-112 log-service Subelements

Element	Required	Description
<a href="#">“module-log-levels” on page 110</a>	zero or one	Specifies log levels.
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

Attributes

The following table describes attributes for the log-service element.

TABLE 1-113 log-service Attributes

Attribute	Default	Description
file	server.log in the directory specified by the log-root attribute of the <a href="#">“domain” on page 51</a> element	(optional) Overrides the name or location of the server log. The file and directory in which the server log is kept must be writable by the user account under which the server runs.  An absolute path overrides the log-root attribute of the <a href="#">“domain” on page 51</a> element.  A relative path is relative to the log-root attribute of the <a href="#">“domain” on page 51</a> element. If no log-root value is specified, it is relative to <i>domain-dir/config</i> .
use-system-logging	false	(optional) If true, uses the UNIX syslog service to produce and manage logs.
log-handler	none	(optional) Specifies a custom log handler to be added to end of the chain of system handlers to log to a different destination.
log-filter	none	(optional) Specifies a log filter to do custom filtering of log records.
log-to-console	false	(optional) Deprecated and ignored.
log-rotation-limit-in-bytes	2000000	(optional) Log files are rotated when the file size reaches the specified limit.
log-rotation-timelimit-in-minutes	0	(optional) Enables time-based log rotation. The valid range is 60 minutes (1 hour) to 14400 minutes (10*24*60 minutes or 10 days).  If the value is zero, the files are rotated based on the size specified in log-rotation-limit-in-bytes. If the value is greater than zero, log-rotation-timelimit-in-minutes takes precedence over log-rotation-limit-in-bytes.
retain-error-statistics-for-hours	5	(optional) Specifies the number of most recent hours for which error statistics are retained in memory. The default and minimum value is 5 hours. The maximum value allowed is 500 hours. Larger values incur additional memory overhead.

# M

## mail-resource

Defines a JavaMail (`javax.mail.Session`) resource.

### Superelements

[“resources” on page 125](#)

### Subelements

The following table describes subelements for the `mail - resource` element.

TABLE 1-114 mail - resource Subelements

Element	Required	Description
<a href="#">“description” on page 50</a>	zero or one	Contains a text description of this element.
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

### Attributes

The following table describes attributes for the `mail - resource` element.

TABLE 1-115 mail - resource Attributes

Attribute	Default	Description
<code>jndi-name</code>	<code>none</code>	Specifies the JNDI name for the resource.
<code>store-protocol</code>	<code>imap</code>	(optional) Specifies the storage protocol service, which connects to a mail server, retrieves messages, and saves messages in folder(s). Allowed values are <code>imap</code> , <code>pop3</code> , <code>imaps</code> , and <code>pop3s</code> .
<code>store-protocol-class</code>	<code>com.sun.mail.imap.IMAPStore</code>	(optional) Specifies the service provider implementation class for storage. Allowed values are:  <code>com.sun.mail.imap.IMAPStore</code>  <code>com.sun.mail.pop3.POP3Store</code>  <code>com.sun.mail.imap.IMAPSSLStore</code>  <code>com.sun.mail.pop3.POP3SSLStore</code>

TABLE 1-115 mail - resource Attributes (Continued)

Attribute	Default	Description
transport-protocol	smtp	(optional) Specifies the transport protocol service, which sends messages. Allowed values are smtp and smtps.
transport-protocol-class	com.sun.mail.smtp.SMTPTransport	(optional) Specifies the service provider implementation class for transport. Allowed values are:  com.sun.mail.smtp.SMTPTransport  com.sun.mail.smtp.SMTPSSLTransport
host	none	The mail server host name.
user	none	The mail server user name.
from	none	The email address the mail server uses to indicate the message sender.
debug	false	(optional) Determines whether debugging for this resource is enabled.
object-type	user	(optional) Defines the type of the resource. Allowed values are: <ul style="list-style-type: none"><li>■ system-all - A system resource for all server instances and the domain application server.</li><li>■ system-admin - A system resource only for the domain application server.</li><li>■ system-instance - A system resource for all server instances only.</li><li>■ user - A user resource.</li></ul>
enabled	true	(optional) Determines whether this resource is enabled at runtime.

## Properties

You can set properties for the mail - resource element and then get these properties in a JavaMail Session object later. Every property name must start with a mail - prefix. The Application Server changes the dash (-) character to a period (.) in the name of the property, then saves the property to the MailConfiguration and JavaMail Session objects. If the name of the property doesn't start with mail -, the property is ignored.

For example, to define the property mail . password in a JavaMail Session object, first edit domain . xml as follows:

```
...
<mail-resource jndi-name="mail/Session" ...>
  <property name="mail-password" value="adminadmin"/>
</mail-resource>
...
```

After getting the `JavaMail Session` object, get the `mail.password` property to retrieve the value `adminadmin`, as follows:

```
String password = session.getProperty("mail.password");
```

## management-rule

Configures a self-management rule, which associates a custom self-tuning, self-configuring, or self-healing action with an event in the Application Server. The action is implemented by an MBean.

### Superelements

[“management-rules” on page 106](#)

### Subelements

The following table describes subelements for the `management-rule` element.

TABLE 1-116 `management-rule` Subelements

Element	Required	Description
<a href="#">“description” on page 50</a>	zero or one	Contains a text description of this element.  This description is included in server log messages about the management rule. For more information on logging, see <a href="#">“log-service” on page 101</a> and <a href="#">“module-log-levels” on page 110</a> .
<a href="#">“event” on page 58</a>	only one	Defines the event that triggers the action associated with a management rule.
<a href="#">“action” on page 23</a>	zero or one	Specifies the action of this management rule. If no action is specified, occurrence of the associated event is logged.

### Attributes

The following table describes attributes for the `management-rule` element.

TABLE 1-117 `management-rule` Attributes

Attribute	Default	Description
<code>name</code>	<code>none</code>	Specifies the name of this management rule.
<code>enabled</code>	<code>true</code>	(optional) If <code>false</code> , disables this management rule.

# management-rules

Configures self-management rules, which associate custom self-tuning, self-configuring, and self-healing actions with events in the Application Server.

## Superelements

[“config” on page 38](#)

## Subelements

The following table describes subelements for the `management - rules` element.

TABLE 1-118    `management - rules` Subelements

Element	Required	Description
<a href="#">“management-rule” on page 105</a>	zero or more	Specifies a management rule.

## Attributes

The following table describes attributes for the `management - rules` element.

TABLE 1-119    `management - rules` Attributes

Attribute	Default	Description
<code>enabled</code>	<code>true</code>	(optional) If <code>false</code> , disables all management rules. If <code>true</code> , the <code>enabled</code> attribute of each rule determines whether it is enabled.

# manager-properties

Specifies session manager properties.

## Superelements

[“session-manager” on page 132](#)

## Subelements

The following table describes subelements for the `manager - properties` element.

TABLE 1-120 manager-properties Subelements

Element	Required	Description
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

## Attributes

The following table describes attributes for the `manager-properties` element.

TABLE 1-121 manager-properties Attributes

Attribute	Default	Description
<code>session-file-name</code>	none; state is not preserved across restarts	(optional) Specifies the absolute or relative path to the directory in which the session state is preserved between application restarts, if preserving the state is possible. A relative path is relative to the temporary directory for this web application. Applicable only if the <code>persistence-type</code> attribute of the <a href="#">“web-container-availability” on page 149</a> element is <code>memory</code> .
<code>reap-interval-in-seconds</code>	60	(optional) Specifies the time between checks for expired sessions.  If the <code>persistence-frequency</code> attribute of the <code>web-container-availability</code> element is set to <code>time-based</code> , active sessions are stored at this interval.  Set this value lower than the frequency at which session data changes. For example, this value should be as low as possible (1 second) for a hit counter servlet on a frequently accessed web site, or you could lose the last few hits each time you restart the server.
<code>max-sessions</code>	-1	(optional) Specifies the maximum number of sessions that can be in cache, or -1 for no limit. After this, an attempt to create a new session causes an <code>IllegalStateException</code> to be thrown.
<code>session-id-generator-classname</code>	internal class generator	(optional) Not implemented. Use the <code>uuid-impl-class</code> property of the <a href="#">“web-container-availability” on page 149</a> element instead.

## mbean

Specifies an MBean, which implements the `javax.management.NotificationListener` interface.

## Superelements

[“applications” on page 28](#)

## Subelements

The following table describes subelements for the `mbean` element.

TABLE 1–122 mbean Subelements

Element	Required	Description
<a href="#">“description” on page 50</a>	zero or one	Contains a text description of this element.
<a href="#">“property” on page 118</a>	zero or more	Specifies a property. Property subelements of the mbean element store the names and values of attributes defined in the MBean implementation class.

## Attributes

The following table describes attributes for the mbean element.

TABLE 1–123 mbean Attributes

Attribute	Default	Description
name	value of impl-class-name	The name of the MBean. The name must represent a value of a property in the <code>property-list</code> of an MBean <code>ObjectName</code> . The name is a primary key for the MBean. This is read-only.
object-type	user	(optional) Defines the type of the resource. This is read-only. Allowed values are: <ul style="list-style-type: none"><li>■ <code>system-all</code> - A system resource for all server instances and the domain application server.</li><li>■ <code>system-admin</code> - A system resource only for the domain application server.</li><li>■ <code>system-instance</code> - A system resource for all server instances only.</li><li>■ <code>user</code> - A user resource.</li></ul>
impl-class-name	none	Defines the fully qualified class name of the MBean implementation. This is read-only.
object-name	none	Defines a system-generated object name for this MBean. This is read-only.
enabled	true	(optional) Determines whether the MBean is enabled. If <code>false</code> , the MBean is not registered in the runtime environment even if the reference is enabled.

## mdb-container

Configures the message-driven bean (MDB) container.

## Superelements

[“config” on page 38](#)

## Subelements

The following table describes subelements for the `mdb-container` element.

TABLE 1-124 mdb-container Subelements

Element	Required	Description
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

## Attributes

The following table describes attributes for the `mdb-container` element.

TABLE 1-125 mdb-container Attributes

Attribute	Default	Description
<code>steady-pool-size</code>	10	(optional) Specifies the initial and minimum number of beans maintained in the pool.
<code>pool-resize-quantity</code>	2	(optional) Specifies the number of beans to be removed when the <code>idle-timeout-in-seconds</code> timer expires. A cleaner thread removes any unused instances.  Must be 0 or greater and less than <code>max-pool-size</code> . The pool is not resized below the <code>steady-pool-size</code> .
<code>max-pool-size</code>	60	(optional) Specifies the maximum number of beans that can be created to satisfy client requests.
<code>idle-timeout-in-seconds</code>	600	(optional) Specifies the maximum time that a bean can remain idle in the pool. After this amount of time, the bean is destroyed. A value of 0 means a bean can remain idle indefinitely.

## Properties

The following table describes properties for the `mdb-container` element.

TABLE 1-126 mdb-container Properties

Property	Default	Description
<code>cmt-max-runtime-exceptions</code>	1	Specifies the maximum number of <code>RuntimeException</code> occurrences allowed from a message-driven bean's <code>onMessage()</code> method when container-managed transactions are used. Deprecated.

## message-security-config

Specifies configurations for message security providers.

## Superelements

[“security-service” on page 128](#)

## Subelements

The following table describes subelements for the `message-security-config` element.

TABLE 1-127 `message-security-config` Subelements

Element	Required	Description
<a href="#">“provider-config” on page 120</a>	one or more	Specifies a configuration for one message security provider.

## Attributes

The following table describes attributes for the `message-security-config` element.

TABLE 1-128 `message-security-config` Attributes

Attribute	Default	Description
<code>auth-layer</code>	SOAP	Specifies the message layer at which authentication is performed. The value must be SOAP or <code>HttpServlet</code> .
<code>default-provider</code>	none	(optional) Specifies the server provider that is invoked for any application not bound to a specific server provider.
<code>default-client-provider</code>	none	(optional) Specifies the client provider that is invoked for any application not bound to a specific client provider.

## module-log-levels

Controls the level of messages logged by server subsystems to the server log. Allowed values (levels) of each subsystem attribute are, from highest to lowest: `FINEST`, `FINER`, `FINE`, `CONFIG`, `INFO`, `WARNING`, `SEVERE`, and `OFF`. Each value logs all messages for all lower values. The default value is `INFO`, which logs all `INFO`, `SEVERE`, and `WARNING` messages.

## Superelements

[“log-service” on page 101](#)

## Subelements

The following table describes subelements for the `module-log-levels` element.

TABLE 1-129 `module-log-levels` Subelements

Element	Required	Description
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

## Attributes

The following table describes attributes for the `module-log-levels` element. The attribute names are the names of the Application Server system loggers.

TABLE 1-130 module-log-levels Attributes

Attribute	Default	Description
root	INFO	(optional) Specifies the default level of messages logged by the entire Application Server installation.
server	INFO	(optional) Specifies the default level of messages logged by the server instance.
ejb-container	INFO	(optional) Specifies the level of messages logged by the EJB container.
cmp-container	INFO	(optional) Specifies the level of messages logged by the CMP subsystem of the EJB container.
mdb-container	INFO	(optional) Specifies the level of messages logged by the MDB container.
web-container	INFO	(optional) Specifies the level of messages logged by the web container.
classloader	INFO	(optional) Specifies the level of messages logged by the classloader hierarchy.
configuration	INFO	(optional) Specifies the level of messages logged by the configuration subsystem.
naming	INFO	(optional) Specifies the level of messages logged by the naming subsystem.
security	INFO	(optional) Specifies the level of messages logged by the security subsystem.
jts	INFO	(optional) Specifies the level of messages logged by the Java Transaction Service.
jta	INFO	(optional) Specifies the level of messages logged by the Java Transaction API.
admin	INFO	(optional) Specifies the level of messages logged by the Administration Console subsystem.
deployment	INFO	(optional) Specifies the level of messages logged by the deployment subsystem.
verifier	INFO	(optional) Specifies the level of messages logged by the deployment descriptor verifier.
jaxr	INFO	(optional) Specifies the level of messages logged by the XML registry.
jaxrpc	INFO	(optional) Specifies the level of messages logged by the XML RPC module.
saaj	INFO	(optional) Specifies the level of messages logged by the SOAP with Attachments API for Java module.
corba	INFO	(optional) Specifies the level of messages logged by the ORB.
javamail	INFO	(optional) Specifies the level of messages logged by the JavaMail subsystem.
jms	INFO	(optional) Specifies the level of messages logged by the Java Message Service.
connector	INFO	(optional) Specifies the level of messages logged by the connector subsystem.
jdo	INFO	(optional) Specifies the level of messages logged by the Java Data Objects module.

TABLE 1-130 module-log-levels Attributes (Continued)

Attribute	Default	Description
cmp	INFO	(optional) Specifies the level of messages logged by the CMP subsystem.
util	INFO	(optional) Specifies the level of messages logged by the utility subsystem.
resource-adapter	INFO	(optional) Specifies the level of messages logged by the resource adapter subsystem.
synchronization	INFO	(optional) Specifies the level of messages logged by the synchronization subsystem.
node-agent	INFO	(optional) Specifies the level of messages logged by the node agent subsystem.
self-management	INFO	(optional) Specifies the level of messages logged by the self-management (management rules) subsystem.
group-management-service	INFO	(optional) Specifies the level of messages logged by the Group Management Service.
management-event	INFO	(optional) Specifies the level of messages logged by the self-management event subsystem.

## module-monitoring-levels

Controls the level of monitoring of server subsystems. Allowed values of each subsystem attribute are LOW, HIGH, and OFF.

### Superelements

[“monitoring-service” on page 113](#)

### Subelements

The following table describes subelements for the module-monitoring-levels element.

TABLE 1-131 module-monitoring-levels Subelements

Element	Required	Description
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

### Attributes

TABLE 1-132 module-monitoring-levels Attributes

Attribute	Default	Description
thread-pool	OFF	(optional) Specifies the level of monitoring of the thread pool subsystem.

TABLE 1-132 module-monitoring-levels Attributes (Continued)

Attribute	Default	Description
orb	OFF	(optional) Specifies the level of monitoring of the ORB.
ejb-container	OFF	(optional) Specifies the level of monitoring of the EJB container.
web-container	OFF	(optional) Specifies the level of monitoring of the web container.
transaction-service	OFF	(optional) Specifies the level of monitoring of the transaction service.
http-service	OFF	(optional) Specifies the level of monitoring of the HTTP service.
jdbc-connection-pool	OFF	(optional) Specifies the level of monitoring of the JDBC connection pool subsystem.
connector-connection-pool	OFF	(optional) Specifies the level of monitoring of the connector connection pool subsystem.
connector-service	OFF	(optional) Specifies the level of monitoring of the connector service.
jms-service	OFF	(optional) Specifies the level of monitoring of the JMS service.
jvm	OFF	(optional) Specifies the level of monitoring of the JVM.

## monitoring-service

Configures the monitoring service.

### Superelements

[“config” on page 38](#)

### Subelements

The following table describes subelements for the monitoring-service element.

TABLE 1-133 monitoring-service Subelements

Element	Required	Description
<a href="#">“module-monitoring-levels” on page 112</a>	zero or one	Controls the level of monitoring of server subsystems.
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

# N

## node-agent

Defines a node agent, which manages server instances on a host machine.

### Superelements

[“node-agents” on page 115](#)

### Subelements

The following table describes subelements for the node-agent element.

TABLE 1–134 node-agent Subelements

Element	Required	Description
<a href="#">“jmx-connector” on page 93</a>	zero or one	Configures a JSR 160/255 compliant remote JMX connector.
<a href="#">“auth-realm” on page 29</a>	zero or one	Defines a realm for authentication.
<a href="#">“log-service” on page 101</a>	only one	Configures the system logging service.
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

### Attributes

The following table describes attributes for the node-agent element.

TABLE 1–135 node-agent Attributes

Attribute	Default	Description
name	none	Specifies the node agent name.
system-jmx-connector-name	none	Specifies the name of the internal <a href="#">“jmx-connector” on page 93</a> .
start-servers-in-startup	true	(optional) If true, starts all managed server instances when the node agent is started.

### Properties

The following table describes properties for the node-agent element.

TABLE 1-136 node-agent Properties

Property	Default	Description
INSTANCE-SYNC-JVM-OPTIONS	default Application Server JVM options	Sets options for the server instance synchronization JVM. Setting options that limit memory usage helps prevent OutOfMemory errors when large applications are synchronized or when memory is constrained. For more information, see the <i>Sun Java System Application Server 9.1 Administration Guide</i> .

## node-agents

Contains node agents.

### Superelements

[“domain” on page 51](#)

### Subelements

The following table describes subelements for the node-agents element.

TABLE 1-137 node-agents Subelements

Element	Required	Description
<a href="#">“node-agent” on page 114</a>	zero or more	Defines a node agent, which manages server instances on a host machine.

## 0

## orb

Configures the ORB.

To enable SSL for outbound connections, include an [“ssl-client-config” on page 135](#) subelement in the parent `iiop-service` element.

### Superelements

[“iiop-service” on page 79](#)

### Subelements

The following table describes subelements for the orb element.

TABLE 1–138 orb Subelements

Element	Required	Description
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

### Attributes

The following table describes attributes for the orb element.

TABLE 1–139 orb Attributes

Attribute	Default	Description
use-thread-pool-ids	none	Specifies a comma-separated list of thread-pool-id values defined in <a href="#">“thread-pool” on page 138</a> elements used by the ORB.
message-fragment-size	1024	(optional) GIOPv1.2 messages larger than this number of bytes are fragmented.
max-connections	1024	(optional) The maximum number of incoming connections on all IIOP listeners. Legal values are integers.

## P

### persistence-manager-factory-resource

Defines a persistence manager factory resource for container-managed persistence (CMP). Deprecated, and included for backward compatibility only. Use a [“jdbc-resource” on page 88](#) element instead.

### Superelements

[“resources” on page 125](#)

### Subelements

The following table describes subelements for the persistence-manager-factory-resource element.

TABLE 1–140 persistence-manager-factory-resource Subelements

Element	Required	Description
<a href="#">“description” on page 50</a>	zero or one	Contains a text description of this element.

TABLE 1-140 persistence-manager-factory-resource Subelements *(Continued)*

Element	Required	Description
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

## Attributes

The following table describes attributes for the persistence-manager-factory-resource element.

TABLE 1-141 persistence-manager-factory-resource Attributes

Attribute	Default	Description
jndi-name	none	Specifies the JNDI name for the resource.
factory-class	com.sun.jdo.spi.persistence.support.sqlstore.impl.PersistenceManagerFactoryImpl	(optional) Deprecated. Do not specify this attribute for the built-in CMP implementation.
jdbc-resource-jndi-name	none	Specifies the <a href="#">“jdbc-resource” on page 88</a> from which database connections are obtained. Must be the jndi-name of an existing jdbc-resource.
object-type	user	(optional) Defines the type of the resource. Allowed values are: <ul style="list-style-type: none"> <li>■ system-all - A system resource for all server instances and the domain application server.</li> <li>■ system-admin - A system resource only for the domain application server.</li> <li>■ system-instance - A system resource for all server instances only.</li> <li>■ user - A user resource.</li> </ul>
enabled	true	(optional) Determines whether this resource is enabled at runtime.

## principal

Contains the principal of the servlet or EJB client.

## Superelements

[“security-map” on page 127](#)

## Subelements

none - contains data

# profiler

Configures a profiler for use with the Application Server. For more information about profilers, see the *Sun Java System Application Server 9.1 Developer’s Guide*.

## Superelements

[“java-config” on page 82](#)

## Subelements

The following table describes subelements for the `profiler` element.

TABLE 1–142 `profiler` Subelements

Element	Required	Description
<a href="#">“jvm-options” on page 95</a>	zero or more	Contains profiler-specific JVM command line options.
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

**Note** – Subelements of a `profiler` element can occur in any order.

## Attributes

The following table describes attributes for the `profiler` element.

TABLE 1–143 `profiler` Attributes

Attribute	Default	Description
<code>name</code>	<code>none</code>	Specifies the name of the profiler.
<code>classpath</code>	<code>none</code>	(optional) Specifies the classpath for the profiler.
<code>native-library-path</code>	<code>none</code>	(optional) Specifies the native library path for the profiler.
<code>enabled</code>	<code>true</code>	(optional) Determines whether the profiler is enabled.

# property

Specifies a property. A property adds configuration information to its parent element that is one or both of the following:

- Optional with respect to the Application Server
- Needed by a system or object that the Application Server doesn’t have knowledge of, such as an LDAP server or a Java class

For example, an `auth-realm` element can include property subelements:

```
<auth-realm name="file"
  classname="com.sun.enterprise.security.auth.realm.file.FileRealm">
  <property name="file" value="domain-dir/config/keyfile"/>
  <property name="jaas-context" value="fileRealm"/>
</auth-realm>
```

Which properties an `auth-realm` element uses depends on the value of the `auth-realm` element's name attribute. The file realm uses `file` and `jaas-context` properties. Other realms use different properties.

## Superelements

“`admin-object-resource`” on page 23, “`admin-service`” on page 24, “`alert-service`” on page 25, “`appliance-module`” on page 26, “`audit-module`” on page 29, “`auth-realm`” on page 29, “`availability-service`” on page 32, “`cluster`” on page 35, “`config`” on page 38, “`connector-connection-pool`” on page 41, “`connector-module`” on page 45, “`connector-resource`” on page 46, “`custom-resource`” on page 47, “`das-config`” on page 48, “`diagnostic-service`” on page 50, “`domain`” on page 51, “`ejb-container`” on page 53, “`ejb-container-availability`” on page 55, “`ejb-module`” on page 56, “`ejb-timer-service`” on page 57, “`event`” on page 58, “`extension-module`” on page 63, “`external-jndi-resource`” on page 64, “`filter-config`” on page 65, “`group-management-service`” on page 66, “`http-listener`” on page 70, “`http-service`” on page 75, “`iiop-listener`” on page 78, “`j2ee-application`” on page 80, “`jacc-provider`” on page 81, “`java-config`” on page 82, “`jdbc-connection-pool`” on page 84, “`jdbc-resource`” on page 88, “`jms-availability`” on page 89, “`jms-host`” on page 90, “`jms-service`” on page 91, “`jmx-connector`” on page 93, “`lb-config`” on page 96, “`lifecycle-module`” on page 97, “`listener-config`” on page 98, “`load-balancer`” on page 99, “`log-service`” on page 101, “`mail-resource`” on page 103, “`management-rule`” on page 105, “`manager-properties`” on page 106, “`mbean`” on page 107, “`mdb-container`” on page 108, “`module-log-levels`” on page 110, “`module-monitoring-levels`” on page 112, “`monitoring-service`” on page 113, “`node-agent`” on page 114, “`orb`” on page 115, “`persistence-manager-factory-resource`” on page 116, “`profiler`” on page 118, “`provider-config`” on page 120, “`resource-adapter-config`” on page 123, “`security-service`” on page 128, “`server`” on page 129, “`session-properties`” on page 133, “`store-properties`” on page 136, “`transaction-service`” on page 139, “`virtual-server`” on page 143, “`web-container`” on page 148, “`web-container-availability`” on page 149, “`web-module`” on page 152

## Subelements

The following table describes subelements for the property element.

TABLE 1-144 property Subelements

Element	Required	Description
<a href="#">“description” on page 50</a>	zero or one	Contains a text description of this element.

## Attributes

The following table describes attributes for the property element.

TABLE 1-145 property Attributes

Attribute	Default	Description
name	none	Specifies the name of the property or variable.
value	none	Specifies the value of the property or variable.

## provider-config

Specifies a configuration for one message security provider.

Although the request-policy and response-policy subelements are optional, the provider-config element does nothing if they are not specified.

Use property subelements to configure provider-specific properties. Property values are passed to the provider when its initialize method is called.

## Superelements

[“message-security-config” on page 109](#)

## Subelements

The following table describes subelements for the provider-config element.

TABLE 1-146 provider-config Subelements

Element	Required	Description
<a href="#">“request-policy” on page 122</a>	zero or one	Defines the authentication policy requirements of the authentication provider’s request processing.
<a href="#">“response-policy” on page 126</a>	zero or one	Defines the authentication policy requirements of the authentication provider’s response processing.
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

## Attributes

The following table describes attributes for the `provider-config` element.

TABLE 1-147 `provider-config` Attributes

Attribute	Default	Description
<code>provider-id</code>	none	Specifies a unique identifier for this <code>provider-config</code> element.
<code>provider-type</code>	none	Specifies whether the provider is a client, server, or client-server authentication provider.
<code>class-name</code>	none	Specifies the Java implementation class of the provider. Client authentication providers must implement the <code>com.sun.enterprise.security.jauth.ClientAuthModule</code> interface. Server authentication providers must implement the <code>com.sun.enterprise.security.jauth.ServerAuthModule</code> interface. Client-server providers must implement both interfaces.

## Properties

The following table describes properties for the `provider-config` element.

TABLE 1-148 `provider-config` Properties

Property	Default	Description
<code>security.config</code>	<code>domain-dir/config/wss-server-config-1.0.xml</code>	Specifies the location of the message security configuration file. To point to a configuration file in the <code>domain-dir/config</code> directory, use the prefix <code>\${com.sun.aas.instanceRoot}/config/</code> , for example:  <code>\${com.sun.aas.instanceRoot}/config/wss-server-config-1.0.xml</code>
<code>debug</code>	false	If true, enables dumping of server provider debug messages to the server log.
<code>dynamic.username.password</code>	false	If true, signals the provider runtime to collect the user name and password from the <code>CallbackHandler</code> for each request. If false, the user name and password for <code>wsse:UsernameToken(s)</code> is collected once, during module initialization. This property is only applicable for a <code>ClientAuthModule</code> .
<code>encryption.key.alias</code>	slas	Specifies the encryption key used by the provider. The key is identified by its keystore alias.
<code>signature.key.alias</code>	slas	Specifies the signature key used by the provider. The key is identified by its keystore alias.

R

registry-location

Specifies the registry where web service endpoint artifacts are published.

Superelements

[“web-service-endpoint” on page 153](#)

Subelements

none

Attributes

The following table describes attributes for the registry-location element.

TABLE 1-149 registry-location Attributes

Attribute	Default	Description
connector-resource-jndi-name	none	Specifies the jndi-name of the <a href="#">“connector-resource” on page 46</a> used as the registry.

request-policy

Defines the authentication policy requirements of the authentication provider’s request processing.

Superelements

[“provider-config” on page 120](#)

Subelements

none

Attributes

The following table describes attributes for the request-policy element.

TABLE 1-150 request-policy Attributes

Attribute	Default	Description
auth-source	none	Specifies the type of required authentication, either sender (user name and password) or content (digital signature).
auth-recipient	none	Specifies whether recipient authentication occurs before or after content authentication. Allowed values are before-content and after-content.

## request-processing

Configures request processing threads.

### Superelements

[“http-service” on page 75](#)

### Subelements

none

### Attributes

The following table describes attributes for the request-processing element.

TABLE 1-151 request-processing Attributes

Attribute	Default	Description
thread-count	5	(optional) Specifies the maximum number of request processing threads.
initial-thread-count	2	(optional) Specifies the number of request processing threads that are available when the server starts up.
thread-increment	1	(optional) Specifies the number of request processing threads added when the number of requests exceeds the initial-thread-count.
request-timeout-in-seconds	60	(optional) Specifies the time at which the request times out.
header-buffer-length-in-bytes	8192	(optional) Specifies the size of the buffer used by the request processing threads to read the request data.

## resource-adapter-config

Defines a connector (resource adapter) configuration. Stores configuration information for the resource adapter JavaBean in property subelements.

## Superelements

[“resources” on page 125](#)

## Subelements

The following table describes subelements for the `resource-adapter-config` element.

TABLE 1-152 `resource-adapter-config` Subelements

Element	Required	Description
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

## Attributes

The following table describes attributes for the `resource-adapter-config` element.

TABLE 1-153 `resource-adapter-config` Attributes

Attribute	Default	Description
<code>name</code>	<code>none</code>	(optional) Not used. See <code>resource-adapter-name</code> .
<code>thread-pool-ids</code>	<code>none</code>	(optional) Specifies the id of a <a href="#">“thread-pool” on page 138</a> element.
<code>object-type</code>	<code>user</code>	(optional) Defines the type of the resource. Allowed values are: <ul style="list-style-type: none"><li>■ <code>system-all</code> - A system resource for all server instances and the domain application server.</li><li>■ <code>system-admin</code> - A system resource only for the domain application server.</li><li>■ <code>system-instance</code> - A system resource for all server instances only.</li><li>■ <code>user</code> - A user resource.</li></ul>
<code>resource-adapter-name</code>	<code>none</code>	Specifies the name attribute of a deployed <a href="#">“connector-module” on page 45</a> . If the resource adapter is embedded in an application, then it is <code>app_name#rar_name</code> .

## Properties

Properties of the `resource-adapter-config` element are the names of setter methods of the `resourceadapter-class` element in the `ra.xml` file, which defines the class name of the resource adapter JavaBean. Any properties defined here override the default values present in `ra.xml`.

## resource-ref

References a resource deployed to the server instance or cluster.

**Note** – Some topics in the documentation pertain to features that are available only in domains that are configured to support clusters. Examples of domains that support clusters are domains that are created with the cluster profile or the enterprise profile. For information about profiles, see “Usage Profiles” in *Sun Java System Application Server 9.1 Administration Guide*.

**Superelements**

[“cluster” on page 35](#), [“server” on page 129](#)

**Subelements**

none

**Attributes**

The following table describes attributes for the resource-ref element.

TABLE 1–154 resource-ref Attributes

Attribute	Default	Description
enabled	true	(optional) Determines whether the resource is enabled.
ref	none	References the name attribute of a “custom-resource” on page 47, “external-jndi-resource” on page 64, “jdbc-resource” on page 88, “mail-resource” on page 103, “persistence-manager-factory-resource” on page 116, “admin-object-resource” on page 23 “resource-adapter-config” on page 123, “jdbc-connection-pool” on page 84, or “connector-connection-pool” on page 41 element.

**resources**

Contains configured resources, such as database connections, JavaMail™ sessions, and so on.

**Note** – You must specify a Java Naming and Directory Interface™ (JNDI) name for each resource. To avoid collisions with names of other enterprise resources in JNDI, and to avoid portability problems, all names in an Application Server application should begin with the string `java:comp/env`.

**Superelements**

[“domain” on page 51](#)

**Subelements**

The following table describes subelements for the resources element.

TABLE 1–155 resources Subelements

Element	Required	Description
<a href="#">“custom-resource” on page 47</a>	zero or more	Defines a custom resource.
<a href="#">“external-jndi-resource” on page 64</a>	zero or more	Defines a resource that resides in an external JNDI repository.
<a href="#">“jdbc-resource” on page 88</a>	zero or more	Defines a JDBC (Java Database Connectivity) resource.
<a href="#">“mail-resource” on page 103</a>	zero or more	Defines a JavaMail resource.
<a href="#">“persistence-manager-factory-resource” on page 116</a>	zero or more	Defines a persistence manager factory resource for CMP. Deprecated. Use a <a href="#">“jdbc-resource” on page 88</a> element instead.
<a href="#">“admin-object-resource” on page 23</a>	zero or more	Defines an administered object for an inbound resource adapter.
<a href="#">“connector-resource” on page 46</a>	zero or more	Defines a connector (resource adapter) resource.
<a href="#">“resource-adapter-config” on page 123</a>	zero or more	Defines a resource adapter configuration.
<a href="#">“jdbc-connection-pool” on page 84</a>	zero or more	Defines the properties that are required for creating a JDBC connection pool.
<a href="#">“connector-connection-pool” on page 41</a>	zero or more	Defines the properties that are required for creating a connector connection pool.

**Note** – Subelements of a resources element can occur in any order.

## response-policy

Defines the authentication policy requirements of the authentication provider’s response processing.

### Superelements

[“provider-config” on page 120](#)

### Subelements

none

### Attributes

The following table describes attributes for the response-policy element.

TABLE 1-156 response-policy Attributes

Attribute	Default	Description
auth-source	none	Specifies the type of required authentication, either sender (user name and password) or content (digital signature).
auth-recipient	none	Specifies whether recipient authentication occurs before or after content authentication. Allowed values are before-content and after-content.

S

security-map

Maps the principal received during servlet or EJB authentication to the credentials accepted by the EIS.

Superelements

[“connector-connection-pool” on page 41](#)

Subelements

The following table describes subelements for the security-map element.

TABLE 1-157 security-map Subelements

Element	Required	Description
<a href="#">“principal” on page 117</a>	one or more	Contains the principal of the servlet or EJB client.
<a href="#">“user-group” on page 143</a>	one or more	Contains the group to which the principal belongs.
<a href="#">“backend-principal” on page 35</a>	only one	Specifies the user name and password required by the EIS.

Attributes

The following table describes attributes for the security-map element.

TABLE 1-158 security-map Attributes

Attribute	Default	Description
name	none	Specifies a name for the security mapping.

# security-service

Defines parameters and configuration information needed by the Java EE security service. For SSL configuration, see “[ssl](#)” on page 134. For connector module security, see “[security-map](#)” on page 127.

## Superelements

“[config](#)” on page 38

## Subelements

The following table describes subelements for the `security-service` element.

TABLE 1-159 security-service Subelements

Element	Required	Description
“ <a href="#">auth-realm</a> ” on page 29	one or more	Defines a realm for authentication.
“ <a href="#">jacc-provider</a> ” on page 81	one or more	Specifies a Java Authorization Contract for Containers (JACC) provider for pluggable authorization.
“ <a href="#">audit-module</a> ” on page 29	zero or more	Specifies an optional plug-in module that implements audit capabilities.
“ <a href="#">message-security-config</a> ” on page 109	zero or more	Specifies configurations for message security providers.
“ <a href="#">property</a> ” on page 118	zero or more	Specifies a property or a variable.

## Attributes

The following table describes attributes for the `security-service` element.

TABLE 1-160 security-service Attributes

Attribute	Default	Description
default-realm	file	(optional) Specifies the active authentication realm (an <code>auth-realm</code> name attribute) for this server instance.
default-principal	none	(optional) Used as the identity of the default security context when necessary and when no principal is provided. This attribute need not be set for normal server operation.
default-principal-password	none	(optional) The password of the default principal. This attribute need not be set for normal server operation.
anonymous-role	attribute is deprecated	(optional) Deprecated. Do not use.

TABLE 1-160 security-service Attributes (Continued)

Attribute	Default	Description
audit-enabled	false	(optional) If true, additional access logging is performed to provide audit information.  Audit information consists of: <ul style="list-style-type: none"> <li>■ Authentication success and failure events</li> <li>■ Servlet and EJB access grants and denials</li> </ul>
jacc	default	(optional) Specifies the name of the “ <a href="#">jacc-provider</a> ” on <a href="#">page 81</a> element to use for setting up the JACC infrastructure. Do not change the default value unless you are adding a custom JACC provider.
audit-modules	default	(optional) Specifies a space-separated list of audit provider modules used by the audit subsystem. The default value refers to the internal log-based audit module.
activate-default-principal-to-role-mapping	false	(optional) Applies a default principal for role mapping to any application that does not have an application-specific mapping defined. Every role is mapped to an instance of a <code>java.security.Principal</code> implementation class defined by <code>mapped-principal-class</code> . This class has the same name as the role.
mapped-principal-class	<code>com.sun.enterprise.deployment.Group</code>	(optional) Customizes the <code>java.security.Principal</code> implementation class used when <code>activate-default-principal-to-role-mapping</code> is set to true.

## server

Defines a server instance, which is a Java EE compliant container. One server instance is specially designated as a domain administration server (DAS). The “[admin-service](#)” on [page 24](#) subelement of the “[config](#)” on [page 38](#) element referenced by a server's `config-ref` attribute determines whether the server is the DAS.

---

**Note** – Server instances are not the same thing as virtual servers. Each server instance is a completely separate server that contains one or more virtual servers.

---

## Superelements

“[servers](#)” on [page 131](#)

## Subelements

The following table describes subelements for the `server` element.

TABLE 1-161 server Subelements

Element	Required	Description
<a href="#">“application-ref” on page 27</a>	zero or more	References an application or module deployed to the server instance.
<a href="#">“resource-ref” on page 124</a>	zero or more	References a resource deployed to the server instance.
<a href="#">“system-property” on page 136</a>	zero or more	Specifies a system property.
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

## Attributes

The following table describes attributes for the server element.

TABLE 1-162 server Attributes

Attribute	Default	Description
name	none	Specifies the name of the server instance.
config-ref	default <a href="#">“config” on page 38</a> element’s name, server-config	(optional) References the name of the <a href="#">“config” on page 38</a> used by the server instance.
node-agent-ref	node agent created when the server instance was created	(optional) References the name of the <a href="#">“node-agent” on page 114</a> used by the server instance.
lb-weight	100	(optional) Specifies a server instance’s relative weight for load balancing.  Each server instance in a cluster has a weight, which represents the relative processing capacity of that instance. Weighted load balancing policies use this weight for load balancing requests within the cluster. It is the responsibility of the administrator to set the relative weights correctly, keeping in mind deployed hardware capacity.

## server-ref

References a server instance.

**Note** – Some topics in the documentation pertain to features that are available only in domains that are configured to support clusters. Examples of domains that support clusters are domains that are created with the cluster profile or the enterprise profile. For information about profiles, see “Usage Profiles” in *Sun Java System Application Server 9.1 Administration Guide*.

## Superelements

[“cluster” on page 35](#), [“lb-config” on page 96](#)

## Subelements

The following table describes subelements for the `server-ref` element.

TABLE 1-163 `server-ref` Subelements

Element	Required	Description
<a href="#">“health-checker” on page 67</a>	zero or one	Defines a health checker for the referenced server instance.

## Attributes

The following table describes attributes for the `server-ref` element.

TABLE 1-164 `server-ref` Attributes

Attribute	Default	Description
<code>ref</code>	<code>none</code>	References the name attribute of a <a href="#">“server” on page 129</a> element.
<code>disable-timeout-in-minutes</code>	<code>30</code>	(optional) Specifies the time it takes this server instance to reach a quiescent state after having been disabled.
<code>lb-enabled</code>	<code>false</code>	(optional) If <code>true</code> , all load-balancers that reference this server instance consider it available to them.
<code>enabled</code>	<code>true</code>	(optional) Determines whether the server instance is enabled.

## servers

Contains server instances.

## Superelements

[“domain” on page 51](#)

## Subelements

The following table describes subelements for the `servers` element.

TABLE 1–165 servers Subelements

Element	Required	Description
<a href="#">“server” on page 129</a>	only one (developer profile)  zero or more (cluster and enterprise profiles)	Defines a server instance.

## session-config

Specifies session configuration information for the entire web container. Individual web applications can override these settings using the corresponding elements in their `sun-web.xml` files.

### Superelements

[“web-container” on page 148](#)

### Subelements

The following table describes subelements for the `session-config` element.

TABLE 1–166 session-config Subelements

Element	Required	Description
<a href="#">“session-manager” on page 132</a>	zero or one	Specifies session manager configuration information.
<a href="#">“session-properties” on page 133</a>	zero or one	Specifies session properties.

## session-manager

Specifies session manager information.

**Note** – The session manager interface is unstable. An unstable interface might be experimental or transitional, and hence might change incompatibly, be removed, or be replaced by a more stable interface in the next release.

### Superelements

[“session-config” on page 132](#)

## Subelements

The following table describes subelements for the `session-manager` element.

TABLE 1-167 `session-manager` Subelements

Element	Required	Description
<a href="#">“manager-properties” on page 106</a>	zero or one	Specifies session manager properties.
<a href="#">“store-properties” on page 136</a>	zero or one	Specifies session persistence (storage) properties.

## session-properties

Specifies session properties.

## Superelements

[“session-config” on page 132](#)

## Subelements

The following table describes subelements for the `session-properties` element.

TABLE 1-168 `session-properties` Subelements

Element	Required	Description
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

## Attributes

TABLE 1-169 `session-properties` Attributes

Attribute	Default	Description
<code>timeout-in-seconds</code>	<code>600</code>	(optional) Specifies the default maximum inactive interval (in seconds) for all sessions created in this web module. If set to <code>0</code> or less, sessions in this web module never expire.  If a <code>session-timeout</code> element is specified in the <code>web.xml</code> file, the <code>session-timeout</code> value overrides any <code>timeout-in-seconds</code> value. If neither <code>session-timeout</code> nor <code>timeout-in-seconds</code> is specified, the <code>timeout-in-seconds</code> default is used.  Note that the <code>session-timeout</code> element in <code>web.xml</code> is specified in minutes, not seconds.

## Properties

The following table describes properties for the `session-properties` element.

TABLE 1-170 session-properties Properties

Property	Default	Description
enableCookies	true	Uses cookies for session tracking if set to true.
enableURLRewriting	true	Enables URL rewriting. This provides session tracking via URL rewriting when the browser does not accept cookies. You must also use an encodeURL or encodeRedirectURL call in the servlet or JavaServer Pages™ (JSP™) page.
idLengthBytes	128	Specifies the number of bytes in this web module’s session ID.

## ssl

Defines SSL (Secure Socket Layer) parameters.

An `ssl` element is required inside an `http-listener` or `iiop-listener` element that has its `security-enabled` attribute set to `on`.

The grandparent “[http-service](#)” on [page 75](#) element has properties that configure global SSL settings.

## Superelements

“[http-listener](#)” on [page 70](#), “[iiop-listener](#)” on [page 78](#), “[jmx-connector](#)” on [page 93](#), “[ssl-client-config](#)” on [page 135](#)

## Subelements

none

## Attributes

The following table describes attributes for the `ssl` element.

TABLE 1-171 ssl Attributes

Attribute	Default	Description
cert-nickname	slas	The nickname of the server certificate in the certificate database or the PKCS#11 token. In the certificate, the name format is <i>tokenname: nickname</i> . Including the <i>tokenname</i> : part of the name in this attribute is optional.
ssl2-enabled	false	(optional) Determines whether SSL2 is enabled.  If both SSL2 and SSL3 are enabled for a “ <a href="#">virtual-server</a> ” on <a href="#">page 143</a> , the server tries SSL3 encryption first. If that fails, the server tries SSL2 encryption.

TABLE 1-171    `ssl` Attributes            (Continued)

Attribute	Default	Description
<code>ssl2-ciphers</code>	<code>none</code>	(optional) A comma-separated list of the SSL2 ciphers used, with the prefix <code>+</code> to enable or <code>-</code> to disable, for example <code>+rc4</code> . Allowed values are <code>rc4</code> , <code>rc4export</code> , <code>rc2</code> , <code>rc2export</code> , <code>idea</code> , <code>des</code> , <code>desede3</code> .
<code>ssl3-enabled</code>	<code>true</code>	(optional) Determines whether SSL3 is enabled. The default is <code>true</code> .  If both SSL2 and SSL3 are enabled for a “ <a href="#">virtual-server</a> ” on <a href="#">page 143</a> , the server tries SSL3 encryption first. If that fails, the server tries SSL2 encryption.
<code>ssl3-tls-ciphers</code>	<code>none</code>	(optional) A comma-separated list of the SSL3 ciphers used, with the prefix <code>+</code> to enable or <code>-</code> to disable, for example <code>+SSL_RSA_WITH_RC4_128_MD5</code> . Allowed values are <code>SSL_RSA_WITH_RC4_128_MD5</code> , <code>SSL_RSA_WITH_3DES_EDE_CBC_SHA</code> , <code>SSL_RSA_WITH_DES_CBC_SHA</code> , <code>SSL_RSA_EXPORT_WITH_RC4_40_MD5</code> , <code>SSL_RSA_WITH_NULL_MD5</code> , <code>SSL_RSA_WITH_RC4_128_SHA</code> , and <code>SSL_RSA_WITH_NULL_SHA</code> . Values available in previous releases are supported for backward compatibility.
<code>tls-enabled</code>	<code>true</code>	(optional) Determines whether TLS is enabled.
<code>tls-rollback-enabled</code>	<code>true</code>	(optional) Determines whether TLS rollback is enabled. TLS rollback should be enabled for Microsoft Internet Explorer 5.0 and 5.5. For more information, see the <i>Sun Java System Application Server 9.1 Administration Guide</i> .
<code>client-auth-enabled</code>	<code>false</code>	(optional) Determines whether SSL3 client authentication is performed on every request, independent of ACL-based access control.

## ssl-client-config

Defines SSL parameters for the ORB when it makes outbound SSL connections and behaves as a client.

### Superelements

“[iiop-service](#)” on [page 79](#)

### Subelements

The following table describes subelements for the `ssl-client-config` element.

TABLE 1-172    `ssl-client-config` Subelements

Element	Required	Description
“ <a href="#">ssl</a> ” on <a href="#">page 134</a>	only one	Defines SSL parameters.

# store-properties

Specifies session persistence (storage) properties.

## Superelements

[“session-manager” on page 132](#)

## Subelements

The following table describes subelements for the store-properties element.

TABLE 1-173 store-properties Subelements

Element	Required	Description
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

## Attributes

TABLE 1-174 store-properties Attributes

Attribute	Default	Description
directory	<i>domain-dir</i> <i>/generated/jsp</i> <i>/j2ee-apps/appname/</i> <i>appname_war</i>	(optional) Specifies the absolute or relative pathname of the directory into which individual session files are written. A relative path is relative to the temporary work directory for this web application. Applicable only if the persistence-type attribute of the <a href="#">“web-container-availability” on page 149</a> element is file.
reap-interval-in-seconds	60	(optional) Not implemented. Use the reap-interval-in-seconds attribute of the <a href="#">“manager-properties” on page 106</a> element instead.

# system-property

Specifies a system property. A system property defines a common value for a setting at one of these levels, from highest to lowest: [“domain” on page 51](#), [“cluster” on page 35](#), [“server” on page 129](#), or [“config” on page 38](#). A value set at a higher level can be overridden at a lower level. Some system properties are predefined; see [“system-property” on page 136](#). You can also create system properties using this element.

The following example shows the use of a predefined system property:

```
<log-service file="{com.sun.aas.instanceRoot}/logs/server.log">  
  <module-log-levels admin=INFO ../>  
</log-service>
```

The following example shows the creation and use of a system property:

```

<config name="config1">
  ...
  <http-service>
    ...
    <http-listener id="ls1" host="0.0.0.0" port="{ls1-port}"/>
    ...
  </http-service>
  ...
  <system-property name="ls1-port" value="8080"/>
</config>

```

## Superelements

[“cluster” on page 35](#), [“config” on page 38](#), [“domain” on page 51](#), [“server” on page 129](#)

## Subelements

The following table describes subelements for the system-property element.

TABLE 1-175 system-property Subelements

Element	Required	Description
<a href="#">“description” on page 50</a>	zero or one	Contains a text description of this element.

## Attributes

The following table describes attributes for the system-property element.

TABLE 1-176 system-property Attributes

Attribute	Default	Description
name	none	Specifies the name of the system property.
value	none	Specifies the value of the system property.

## Properties

The following table lists predefined system properties.

TABLE 1-177 Predefined System Properties

Property	Default	Description
com.sun.aas.installRoot	depends on operating system	Specifies the directory where the Application Server is installed.

TABLE 1-177    Predefined System Properties        (Continued)

Property	Default	Description
com.sun.aas.instanceRoot	depends on operating system	Specifies the top level directory for a server instance.
com.sun.aas.hostName	none	Specifies the name of the host (machine).
com.sun.aas.javaRoot	depends on operating system	Specifies the installation directory for the Java runtime.
com.sun.aas.imqLib	depends on operating system	Specifies the library directory for the Sun Java System Message Queue software.
com.sun.aas.configName	server-config	Specifies the name of the “ <a href="#">config</a> ” on <a href="#">page 38</a> used by a server instance.
com.sun.aas.instanceName	server1	Specifies the name of the server instance. This property is not used in the default configuration, but can be used to customize configuration.
com.sun.aas.clusterName	cluster1	Specifies the name of the cluster. This property is only set on clustered server instances. This property is not used in the default configuration, but can be used to customize configuration.
com.sun.aas.domainName	domain1	Specifies the name of the domain. This property is not used in the default configuration, but can be used to customize configuration.

T

thread-pool

Defines a thread pool.

Superelements

“[thread-pools](#)” on [page 139](#)

Subelements

none

## Attributes

TABLE 1-178 thread-pool Attributes

Attribute	Default	Description
thread-pool-id	none	Specifies the thread pool ID.
min-thread-pool-size	0	(optional) Specifies the minimum number of threads in the pool. These are created when the thread pool is instantiated.
max-thread-pool-size	200	(optional) Specifies the maximum number of threads the pool can contain.
idle-thread-timeout-in-seconds	120	(optional) Specifies the amount of time after which idle threads are removed from the pool.
num-work-queues	1	(optional) Specifies the total number of work queues serviced by this thread pool.

## thread-pools

Contains thread pools.

### Superelements

[“config” on page 38](#)

### Subelements

The following table describes subelements for the `thread-pools` element.

TABLE 1-179 thread-pools Subelements

Element	Required	Description
<a href="#">“thread-pool” on page 138</a>	one or more	Defines a thread pool.

## transaction-service

Configures the Java Transaction Service (JTS).

### Superelements

[“config” on page 38](#)

### Subelements

The following table describes subelements for the `transaction-service` element.

TABLE 1-180 transaction-service Subelements

Element	Required	Description
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

## Attributes

The following table describes attributes for the transaction-service element.

TABLE 1-181 transaction-service Attributes

Attribute	Default	Description
automatic-recovery	false (developer profile)  true (cluster and enterprise profiles)	(optional) If true, the server instance attempts transaction recovery during startup.
timeout-in-seconds	0	(optional) Specifies the amount of time after which the transaction is aborted. If set to 0, the transaction never times out.
tx-log-dir	directory specified by the log-root attribute of the <a href="#">“domain” on page 51</a> element	(optional) Specifies the parent directory of the transaction log directory <i>instance-name</i> /tx. The directory in which the transaction logs are kept must be writable by the user account under which the server runs. A relative path is relative to the log-root attribute of the <a href="#">“domain” on page 51</a> element.
heuristic-decision	rollback	(optional) If the outcome of a distributed transaction cannot be determined because other participants are unreachable, this property determines the outcome. Allowed values are rollback and commit.
retry-timeout-in-seconds	600	(optional) Determines the retry time in the following scenarios: <ul style="list-style-type: none"><li>At the transaction recovery time, if resources are unreachable.</li><li>If there are any transient exceptions in the second phase of a two phase commit protocol.</li></ul> A negative value specifies infinite retries. A value of 0 (zero) specifies no retries. A positive value indicates the time after which a retry is attempted.
keypoint-interval	65536 (64 K)	(optional) Specifies the number of transactions between keypoint operations in the log. Keypoint operations reduce the size of the transaction log file by compressing it. A larger value for this attribute results in a larger transaction log file, but fewer keypoint operations and potentially better performance. A smaller value results in smaller log files, but slightly reduced performance due to the greater frequency of keypoint operations.

## Properties

The following table describes properties for the transaction-service element.

TABLE 1-182 transaction-service Properties

Property	Default	Description
oracle-xa-recovery-workaround	true	If true, the Oracle XA Resource workaround is used in transaction recovery.
disable-distributed-transaction-logging	false	If true, disables transaction logging, which might improve performance. If the automatic-recovery attribute is set to true, this property is ignored.
xaresource-txn-timeout	specific to the XAResource used	Changes the XAResource timeout. In some cases, the XAResource default timeout can cause transactions to be aborted, so it is desirable to change it.
pending-txn-cleanup-interval	none if this property is absent, 60 if this property is present but has no value	Specifies the interval, in seconds, at which an asynchronous thread checks for pending transactions and completes them.
use-last-agent-optimization	true	If true, enables last agent optimization, which improves the throughput of transactions. If one non-XA resource is used with XA resources in the same transaction, the non XA resource is the last agent.
delegated-recovery	false	If true, cluster-wide delegated recovery is enabled. You must also facilitate storing of transaction logs in a shared file system in one of these ways: <ul style="list-style-type: none"> <li>■ Set the “domain” on page 51 element’s log-root attribute to a shared file system base directory and set the tx-log-dir attribute to a relative path.</li> <li>■ Set tx-log-dir to an absolute path to a shared file system directory, in which case log-root is ignored for transaction logs.</li> <li>■ Set a “system-property” on page 136 called TX-LOG-DIR to a shared file system directory. For example: <pre>&lt;server config-ref="server-config" name="server"&gt;   &lt;system-property name="TX-LOG-DIR"     value="/net/tulsa/nodeagents/na/instance1/logs"/&gt; &lt;/server&gt;</pre> </li> </ul>
wait-time-before-recovery-insec	60	Specifies the wait time, in seconds, after which an instance starts the recovery for a dead instance.
db-logging-resource	none	Specifies the JNDI name of the JDBC resource for the database to which transactions are logged. For more information, see Chapter 16, “Using the Transaction Service,” in <i>Sun Java System Application Server 9.1 Developer’s Guide</i> .

# transformation-rule

Configures an eXtensible Stylesheet Language Transformation (XSLT) rule, which transforms a web service message.

## Superelements

[“web-service-endpoint” on page 153](#)

## Subelements

The following table describes subelements for the `transformation-rule` element.

TABLE 1-183 transformation-rule Subelements

Element	Required	Description
<a href="#">“description” on page 50</a>	zero or one	Contains a text description of this element.

## Attributes

The following table describes attributes for the `transformation-rule` element.

TABLE 1-184 transformation-rule Attributes

Attribute	Default	Description
<code>name</code>	<code>none</code>	The name of the rule.
<code>enabled</code>	<code>true</code>	(optional) Determines whether the rule is enabled.
<code>apply-to</code>	<code>request</code>	(optional) Specifies whether the rule is applied to the request, the response, or both. Allowed values are: <ul style="list-style-type: none"><li>■ <code>request</code> - Transformations are applied to the request in the order specified.</li><li>■ <code>response</code> - Transformations are applied to the response in the order specified.</li><li>■ <code>both</code> - Transformations are applied to both the request and the response. The order is reversed for the response.</li></ul>
<code>rule-file-location</code>	<code>domain-dir/generated/xml/app-or-module/xslt-file</code>	A fully qualified or relative path to the rule file that performs the transformation. Only XSLT files are allowed.

# U

## user-group

Contains the group to which the principal belongs.

### Superelements

“security-map” on page 127

### Subelements

none - contains data

# V

## virtual-server

Defines a virtual server. A virtual server, also called a virtual host, is a virtual web server that serves content targeted for a specific URL. Multiple virtual servers can serve content using the same or different host names, port numbers, or IP addresses. The HTTP service can direct incoming web requests to different virtual servers based on the URL.

When the Application Server is first installed, a default virtual server is created. (You can also assign a default virtual server to each new “[http-listener](#)” on page 70 you create.)

---

**Note** – Virtual servers are not the same thing as server instances. Each server instance is a completely separate server that contains one or more virtual servers.

---

Before the Application Server can process a request, it must accept the request via a listener, then direct the request to the correct virtual server. The virtual server is determined as follows:

- If the listener is configured to only a default virtual server, that virtual server is selected.
- If the listener has more than one virtual server configured to it, the request Host header is matched to the hosts attribute of a virtual server. If no Host header is present or no hosts attribute matches, the default virtual server for the listener is selected.

If a virtual server is configured to an SSL listener, its hosts attribute is checked against the subject pattern of the certificate at server startup, and a warning is generated and written to the server log if they don’t match.

## Superelements

[“http-service” on page 75](#)

## Subelements

The following table describes subelements for the `virtual-server` element.

TABLE 1-185 `virtual-server` Subelements

Element	Required	Description
<a href="#">“http-access-log” on page 68</a>	zero or one	Defines an access log file.
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

## Attributes

The following table describes attributes for the `virtual-server` element.

TABLE 1-186 `virtual-server` Attributes

Attribute	Default	Description
<code>id</code>	<code>none</code>	Virtual server ID. This is a unique ID that allows lookup of a specific virtual server. A virtual server ID cannot begin with a number.
<code>http-listeners</code>	<code>none</code>	(optional) In a comma-separated list, references <code>id</code> attributes of <a href="#">“http-listener” on page 70</a> elements that specify the connection(s) the virtual server uses. Required only for a <code>virtual-server</code> that is not referenced by the <code>default-virtual-server</code> attribute of an <code>http-listener</code> .
<code>default-web-module</code>	<code>none</code>	(optional) References the <code>name</code> attribute of the default <a href="#">“web-module” on page 152</a> for this virtual server, which responds to requests that cannot be resolved to other web modules deployed to this virtual server (see the <a href="#">“application-ref” on page 27</a> element).
<code>hosts</code>	<code>none</code>	A comma-separated list of values, each of which selects the current virtual server when included in the <code>Host</code> request header. Two or more <code>virtual-server</code> elements that reference or are referenced by the same <code>http-listener</code> cannot have any <code>hosts</code> values in common.
<code>state</code>	<code>on</code>	(optional) Determines whether a <code>virtual-server</code> is active ( <code>on</code> ) or inactive ( <code>off</code> , <code>disabled</code> ). The default is <code>on</code> (active). When inactive, a <code>virtual-server</code> does not service requests. If a <code>virtual-server</code> is disabled, only the global server administrator can turn it on.
<code>docroot</code>	<code>none</code>	(optional) Specifies the document root for this virtual server.

TABLE 1-186 virtual-server Attributes (Continued)

Attribute	Default	Description
log-file	server.log in the directory specified by the log-root attribute of the “domain” on page 51 element	(optional) Writes this virtual server’s log messages to a log file separate from the server log. The file and directory in which the virtual server log is kept must be writable by the user account under which the server runs. See the “log-service” on page 101 description for details about logs.

## Properties

The following table describes properties for the virtual-server element.

TABLE 1-187 virtual-server Properties

Property	Default	Description
sso-enabled	false (developer and cluster profiles) true (enterprise profile)	If true, single sign-on is enabled for web applications on this virtual server that are configured for the same realm. If false, single sign-on is disabled for this virtual server, and users must authenticate separately to every application on the virtual server. This setting overrides the sso-enabled property setting of the “http-service” on page 75 element.
sso-max-inactive-seconds	300	Specifies the time after which a user’s single sign-on record becomes eligible for purging if no client activity is received. Since single sign-on applies across several applications on the same virtual server, access to any of the applications keeps the single sign-on record active. Higher values provide longer single sign-on persistence for the users at the expense of more memory use on the server.
sso-reap-interval-seconds	60	Specifies the interval between purges of expired single sign-on records.
setCacheControl	none	Specifies a comma-separated list of Cache-Control response directives. For a list of valid directives, see section 14.9 of the document at <a href="http://www.ietf.org/rfc/rfc2616.txt">http://www.ietf.org/rfc/rfc2616.txt</a> .
accessLoggingEnabled	false (developer and cluster profiles) true (enterprise profile)	If true, enables access logging for this virtual server only. If false, disables access logging for this virtual server only.
accessLogBufferSize	32768	Specifies the size, in bytes, of the buffer where access log calls are stored. If the value is less than 5120, a warning message is issued, and the value is set to 5120. To set this property for all virtual servers, set it as a property of the parent “http-service” on page 75 element.

TABLE 1-187 virtual-server Properties (Continued)

Property	Default	Description
accessLogWriterInterval	300	Specifies the number of seconds before the log is written to the disk. The access log is written when the buffer is full or when the interval expires. If the value is 0, the buffer is always written even if it is not full. This means that each time the server is accessed, the log message is stored directly to the file. To set this property for all virtual servers, set it as a property of the parent “ <a href="#">http-service</a> ” on page 75 element.
allowRemoteAddress	none	Specifies a comma-separated list of regular expression patterns that the remote client's IP address is compared to. If this property is specified, the remote address <i>must</i> match for this request to be accepted. If this property is not specified, all requests are accepted <i>unless</i> the remote address matches a denyRemoteAddress pattern.
denyRemoteAddress	none	Specifies a comma-separated list of regular expression patterns that the remote client's IP address is compared to. If this property is specified, the remote address <i>must not</i> match for this request to be accepted. If this property is not specified, request acceptance is governed solely by the allowRemoteAddress property.
allowRemoteHost	none	Specifies a comma-separated list of regular expression patterns that the remote client's hostname (as returned by <code>[ java.net. ]Socket.getInetAddress().getHostName()</code> ) is compared to. If this property is specified, the remote hostname <i>must</i> match for this request to be accepted. If this property is not specified, all requests are accepted <i>unless</i> the remote hostname matches a denyRemoteHost pattern.
denyRemoteHost	none	Specifies a comma-separated list of regular expression patterns that the remote client's hostname (as returned by <code>[ java.net. ]Socket.getInetAddress().getHostName()</code> ) is compared to. If this property is specified, the remote hostname <i>must not</i> match for this request to be accepted. If this property is not specified, request acceptance is governed solely by the allowRemoteHost property.
authRealm	none	Specifies the name attribute of an “ <a href="#">auth-realm</a> ” on page 29 element, which overrides the server instance's default realm for stand-alone web applications deployed to this virtual server. A realm defined in a stand-alone web application's <code>web.xml</code> file overrides the virtual server's realm.
securePagesWithPragma	true	Set this property to false to ensure that for all web applications on this virtual server file downloads using SSL work properly in Internet Explorer.  You can set this property for a specific web application. For details, see “sun-web-app” in <i>Sun Java System Application Server 9.1 Application Deployment Guide</i> .

TABLE 1-187 virtual-server Properties (Continued)

Property	Default	Description
alternatedocroot_ <i>n</i>	none	<p>Specifies an alternate document root (docroot), where <i>n</i> is a positive integer that allows specification of more than one. Alternate docroots allow web applications to serve requests for certain resources from outside their own docroot, based on whether those requests match one (or more) of the URI patterns of the web application's alternate docroots.</p> <p>If a request matches an alternate docroot's URI pattern, it is mapped to the alternate docroot by appending the request URI (minus the web application's context root) to the alternate docroot's physical location (directory). If a request matches multiple URI patterns, the alternate docroot is determined according to the following precedence order:</p> <ul style="list-style-type: none"> <li>■ Exact match</li> <li>■ Longest path match</li> <li>■ Extension match</li> </ul> <p>For example, the following properties specify three alternate docroots. The URI pattern of the first alternate docroot uses an exact match, whereas the URI patterns of the second and third alternate docroots use extension and longest path prefix matches, respectively.</p> <pre>&lt;property name="alternatedocroot_1"   value="from=/my.jpg dir=/srv/images/jpg"/&gt; &lt;property name="alternatedocroot_2"   value="from=*.jpg dir=/srv/images/jpg"/&gt; &lt;property name="alternatedocroot_3"   value="from=/jpg/* dir=/src/images"/&gt;</pre> <p>The value of each alternate docroot has two components: The first component, <i>from</i>, specifies the alternate docroot's URI pattern, and the second component, <i>dir</i>, specifies the alternate docroot's physical location (directory). Spaces are allowed in the <i>dir</i> component.</p> <p>You can set this property for a specific web application. For details, see “sun-web-app” in <i>Sun Java System Application Server 9.1 Application Deployment Guide</i>.</p>
contextXmlDefault	none	<p>Specifies the location, relative to <i>domain-dir</i>, of the <i>context.xml</i> file for this virtual server, if one is used. For more information about the <i>context.xml</i> file, see <a href="http://tomcat.apache.org/tomcat-5.5-doc/config/context.html">The Context Container</a> (<a href="http://tomcat.apache.org/tomcat-5.5-doc/config/context.html">http://tomcat.apache.org/tomcat-5.5-doc/config/context.html</a>).</p>
allowLinking	false	<p>If <i>true</i>, resources that are symbolic links in web applications on this virtual server are served. The value of this property in the <i>sun-web.xml</i> file takes precedence if defined. For details, see “sun-web-app” in <i>Sun Java System Application Server 9.1 Application Deployment Guide</i>.</p> <p><b>Caution</b> – Setting this property to <i>true</i> on Windows systems exposes JSP source code.</p>

TABLE 1-187 virtual-server Properties (Continued)

Property	Default	Description
send-error_n	none	<p>Specifies custom error page mappings for the virtual server, which are inherited by all web applications deployed on the virtual server. A web application can override these custom error page mappings in its web.xml deployment descriptor. The value of each send-error_n property has three components, which may be specified in any order:</p> <p>The first component, code, specifies the three-digit HTTP response status code for which the custom error page should be returned in the response.</p> <p>The second component, path, specifies the absolute or relative file system path of the custom error page. A relative file system path is interpreted as relative to the domain-dir/config directory.</p> <p>The third component, reason, is optional and specifies the text of the reason string (such as Unauthorized or Forbidden) to be returned.</p> <p>For example:</p> <pre>&lt;property name="send-error_1"   value="code=401 path=/myhost/401.html reason=MY-401-REASON"/&gt;</pre> <p>This example property definition causes the contents of /myhost/401.html to be returned with 401 responses, along with this response line:</p> <pre>HTTP/1.1 401 MY-401-REASON</pre>

W

web-container

Configures the web container.

Superelements

[“config” on page 38](#)

Subelements

The following table describes subelements for the web-container element.

TABLE 1-188 web-container Subelements

Element	Required	Description
<a href="#">“session-config” on page 132</a>	zero or one	Specifies session configuration information for the web container.
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

## Properties

The following table describes properties for the web-container element.

TABLE 1-189 web-container Properties

Property	Default	Description
dispatcher-max-depth	20	Prevents recursive include or forward statements from creating an infinite loop by setting a maximum nested dispatch level. If this level is exceeded, the following message is written to the server log:  Exceeded maximum depth for nested request dispatches

## web-container-availability

Enables availability in the web container, including HTTP session persistence. If HADB is installed and you have selected the enterprise profile, sessions are persisted to the HADB.

If availability is disabled, there is no high availability for HTTP session persistence. In other words, `persistence-type=memory`.

If availability is enabled but no other `web-container-availability` attributes are specified, the default session persistence configuration is as follows:

```
persistence-type=replicated
persistence-frequency=time-based
persistence-scope=session
```

If HADB is installed and you have selected the enterprise profile, the default persistence type is `ha`.

The default configuration for all applications can be changed by setting the various `web-container-availability` attributes and properties.

You can override the various `web-container-availability` attributes and properties for a specific application in `sun-web.xml`. For details, see the *Sun Java System Application Server 9.1 Developer's Guide*.

For additional replicated session persistence properties you can set, see [“availability-service” on page 32](#).

## Superelements

[“availability-service” on page 32](#)

## Subelements

The following table describes subelements for the `web-container-availability` element.

TABLE 1-190 web-container-availability Subelements

Element	Required	Description
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

## Attributes

The following table describes attributes for the `web-container-availability` element.

TABLE 1-191 web-container-availability Attributes

Attribute	Default	Description
<code>availability-enabled</code>	<code>true</code>	(optional) If set to <code>true</code> , and if availability is enabled for the server instance (see <a href="#">“availability-service” on page 32</a> ), high-availability features apply to all web applications deployed to the server instance that do not have availability disabled. All instances in a cluster should have the same availability value to ensure consistent behavior.
<code>persistence-type</code>	<code>memory</code>	<p>(optional) Specifies the session persistence mechanism for web applications that have availability enabled. Allowed values are <code>memory</code> (no persistence), <code>file</code> (the file system) and <code>replicated</code> (other servers). If HADB is installed and you have selected the enterprise profile, you can also specify <code>ha</code>. For production environments that require session persistence, use <code>ha</code>.</p> <p>If set to <code>memory</code>, the <a href="#">“manager-properties” on page 106</a> element’s <code>session-file-name</code> attribute specifies the file system location where the HTTP session state is stored if the server instance is gracefully shut down. This is useful for internal testing but is not supported for production environments.</p> <p>If set to <code>file</code>, the <a href="#">“store-properties” on page 136</a> element’s <code>directory</code> attribute specifies the file system location where the HTTP session state is stored. Persisting to the file system is useful for internal testing but is not supported for production environments.</p>

TABLE 1-191 web-container-availability Attributes (Continued)

Attribute	Default	Description
persistence-frequency	web-method	<p>(optional) Specifies how often the session state is stored. Applicable only if the persistence-type is replicated or ha. Allowed values are as follows:</p> <ul style="list-style-type: none"> <li>web-method - The session state is stored at the end of each web request prior to sending a response back to the client. This mode provides the best guarantee that the session state is fully updated in case of failure.</li> <li>time-based - The session state is stored in the background at the frequency set by the “<a href="#">manager-properties</a>” on <a href="#">page 106</a> element’s reap-interval-in-seconds attribute. This mode provides less of a guarantee that the session state is fully updated. However, it can provide a significant performance improvement because the state is not stored after each request.</li> </ul>
persistence-scope	session	<p>(optional) Specifies how much of the session state is stored. Applicable only if the persistence-type is replicated or ha. Allowed values are as follows:</p> <ul style="list-style-type: none"> <li>session - The entire session state is stored every time. This mode provides the best guarantee that your session data is correctly stored for any distributable web application.</li> <li>modified-session - The entire session state is stored if it has been modified. A session is considered to have been modified if HttpSession.setAttribute() or HttpSession.removeAttribute() was called. You must guarantee that setAttribute() is called every time an attribute is changed. This is not a Java EE specification requirement, but it is required for this mode to work properly.</li> <li>modified-attribute - Only modified session attributes are stored. For this mode to work properly, you must follow some guidelines, which are explained immediately following this table.</li> </ul>
sso-failover-enabled	false	<p>(optional) If true, the single sign-on state is highly available. To enable single sign-on, use the sso-enabled property of the “<a href="#">virtual-server</a>” on <a href="#">page 143</a> element.</p>
http-session-store-pool-name	“ <a href="#">availability-service</a> ” on <a href="#">page 32</a> store-pool-name attribute value	<p>(optional) Specifies the jndi-name of the “<a href="#">jdbc-resource</a>” on <a href="#">page 88</a> used for connections to the HADB for session persistence. Applicable if HADB is installed and you have selected the enterprise profile.</p> <p>For more information about setting up a connection pool and JDBC resource for the HADB, see the description of the configure-ha-cluster command in the <i>Sun Java System Application Server 9.1 Reference Manual</i>.</p>

If the persistence-scope attribute is set to modified-attribute, your web application must follow these guidelines:

- Call setAttribute() every time the session state is modified.

- Make sure there are no cross-references between attributes. The object graph under each distinct attribute key is serialized and stored separately. If there are any object cross references between the objects under each separate key, they are not serialized and deserialized correctly.
- Distribute the session state across multiple attributes, or at least between a read-only attribute and a modifiable attribute.

Properties

The following table describes properties for the web-container-availability element.

TABLE 1-192 web-container-availability Properties

Property	Default	Description
uuid-impl-class	none	Specifies the name of the class that generates session IDs. If this property is not specified, the Application Server's internal session ID generator is used.  It is the developer's responsibility to ensure that generated IDs are universally unique even when running on multiple JVMs on multiple machines in a cluster. Failure to ensure this in the algorithm results in nondeterministic behavior and likely corruption of HTTP session data.

web-module

Specifies a deployed web module.

Superelements

[“applications” on page 28](#)

Subelements

The following table describes subelements for the web-module element.

TABLE 1-193 web-module Subelements

Element	Required	Description
<a href="#">“description” on page 50</a>	zero or one	Contains a text description of this element.
<a href="#">“web-service-endpoint” on page 153</a>	zero or more	Configures a web service endpoint.
<a href="#">“property” on page 118</a>	zero or more	Specifies a property or a variable.

Attributes

The following table describes attributes for the web-module element.

TABLE 1-194 web-module Attributes

Attribute	Default	Description
name	none	The name of the web module.
context-root	none	<p>The context root at which the web module is deployed. The context root can be the empty string or just /. The context root can start with the / character, but doesn't have to.</p> <p>For load balancing to work, web module context roots must be unique within a cluster. See the <i>Sun Java System Application Server 9.1 High Availability Administration Guide</i> for more information about load balancing.</p> <p><b>Note</b> – Some topics in the documentation pertain to features that are available only in domains that are configured to support clusters. Examples of domains that support clusters are domains that are created with the cluster profile or the enterprise profile. For information about profiles, see “Usage Profiles” in <i>Sun Java System Application Server 9.1 Administration Guide</i>.</p>
location	none	<p>A fully qualified or relative path to the directory to which the contents of the .war file have been extracted. If relative, it is relative to the following directory:</p> <p><i>domain-dir/applications/j2ee-modules/</i></p>
object-type	user	<p>(optional) Defines the type of the resource. Allowed values are:</p> <ul style="list-style-type: none"> <li>■ system-all - A system resource for all server instances and the domain application server.</li> <li>■ system-admin - A system resource only for the domain application server.</li> <li>■ system-instance - A system resource for all server instances only.</li> <li>■ user - A user resource.</li> </ul>
enabled	true	(optional) Determines whether the web module is enabled.
libraries	none	<p>(optional) Specifies an absolute or relative path to libraries specific to this module or application. A relative path is relative to <i>domain-dir/lib/applibs</i>. If the path is absolute, the path must be accessible to the domain administration server (DAS), which means it must be under <i>domain-dir</i>. To include more than one path, use a system-specific separator, such as a colon for Solaris or a semicolon for Windows. The libraries are made available to the application in the order in which they are specified.</p>
availability-enabled	false	<p>(optional) Specifies whether availability is enabled in this web application for HTTP session persistence (and potentially passivation). Availability must also be enabled for the application or stand-alone web module during deployment. For more information about availability, see <a href="#">“availability-service” on page 32</a>.</p>
directory-deployed	false	(optional) Specifies whether the application has been deployed as a directory.

## web-service-endpoint

Configures a web service endpoint, which can be a JAX-RPC/JAXWS 2.0 or JSR-109 web service.

## Superelements

[“ejb-module” on page 56](#), [“j2ee-application” on page 80](#), [“web-module” on page 152](#)

## Subelements

The following table describes subelements for the `web-service-endpoint` element.

TABLE 1-195 `web-service-endpoint` Subelements

Element	Required	Description
<a href="#">“registry-location” on page 122</a>	zero or more	Specifies the registry where web service endpoint artifacts are published.
<a href="#">“transformation-rule” on page 142</a>	zero or more	Configures an eXtensible Stylesheet Language Transformation (XSLT) rule.

## Attributes

The following table describes attributes for the `web-service-endpoint` element.

TABLE 1-196 `web-service-endpoint` Attributes

Attribute	Default	Description
<code>name</code>	<code>none</code>	The fully qualified name of the web service. For a web service endpoint within an application, the format is as follows:  <i>module-name#endpoint-name</i>  For example:  <code>jaxrpc-simple.war#HelloIF</code>  For a web service endpoint that is a stand-alone module, the name is just the <i>endpoint-name</i> .
<code>monitoring</code>	<code>OFF</code>	(optional) Specifies the monitoring level for this web service. For information about monitoring levels, see <a href="#">“module-monitoring-levels” on page 112</a> .
<code>max-history-size</code>	<code>25</code>	(optional) Specifies the maximum number of monitoring records stored for this endpoint.
<code>jbi-enabled</code>	<code>false</code>	(optional) Determines whether the visibility of this endpoint as a Java Business Integration service is enabled or disabled.
